

State of the Economy and Prospects

1

CHAPTER

Managing growth and price stability are the major challenges of macroeconomic policymaking. In 2011-12, India found itself in the heart of these conflicting demands. The Indian economy is estimated to grow by 6.9 per cent in 2011-12, after having grown at the rate of 8.4 per cent in each of the two preceding years. This indicates a slowdown compared not just to the previous two years but 2003 to 2011 (except 2008-9). At the same time, sight must not be lost of the fact that, by any cross-country comparison, India remains among the front-runners. With agriculture and services continuing to perform well, India's slowdown can be attributed almost entirely to weakening industrial growth. The manufacturing sector grew by 2.7 per cent and 0.4 per cent in the second and third quarters of 2011-12. Inflation as measured by the wholesale price index (WPI) was high during most of the current fiscal year, though by the year's end there was a clear slowdown. Food inflation, in particular, has come down to around zero, with most of the remaining WPI inflation being driven by non-food manufacturing products. Monetary policy was tightened by the Reserve Bank of India (RBI) during the year to control inflation and curb inflationary expectations. The slowing inflation reflects the lagged impact of actions taken by the RBI and the government. Reflecting the weak manufacturing activity and rising costs, revenues of the centre have remained less than anticipated; and, with higher-than-budgeted expenditure outgo, a slippage is expected on the fiscal side. The global economic environment, which has been tenuous at best throughout the year, turned sharply adverse in September 2011 owing to the turmoil in the eurozone, and questions about the outlook on the US economy provoked by rating agencies. However, for the Indian economy, the outlook for growth and price stability at this juncture looks more promising. There are signs from some high frequency indicators that the weakness in economic activity has bottomed out and a gradual upswing is imminent.

1.2 The macroeconomic situation in February 2011 — at the time of presentation of Economic Survey 2010-11 — looked positive, even though there was some concern about industrial slowdown. Economic Survey 2010-11 had anticipated that the Indian economy would register growth of around 9 per cent (+ or - 0.25 per cent) in 2011-12, almost reverting to the pre-crisis levels achieved during the three-year period 2005-6 to 2007-8. The optimism was driven in part by the fact that the economy had achieved a

growth rate of 8.4 per cent during the years 2009-10 and 2010-11 and the savings and investment rates had begun rising once again. However, during the course of the year it became increasingly clear that economy would fall short of that growth rate by a significant margin for various reasons. This was indeed pointed out in the Mid-Year Analysis for the year 2011-12 that had stated that the Indian economy was expected to register a growth rate of 7.5 per cent during the year. As it happens, the

economy is expected to register a growth rate of 6.9 per cent in 2011-12, as per the Advance Estimates (AE) released by the Central Statistics Office (CSO) on 7 February 2012. At sectoral level, growth is estimated to be 2.5 per cent for 2011-12 for agriculture and allied sectors, a little lower than expected. However, this has to be seen in light of the high growth of 7 per cent achieved in 2010-11. Growth in the services sector is likely to be 9.4 per cent in 2011-12 as against 9.3 per cent in 2010-11. Thus, it is primarily the dip in growth in industry to 3.9 per cent in 2011-12 that has led to the slowdown in real gross domestic product (GDP) growth (Table 1.1).

1.3 With the exception of the year 2008-9 when the growth rate was 6.7 per cent, the growth in real GDP in 2011-12 has been the lowest in nine years. This speaks well of the last nine years but must also be treated as a wake-up call. Like in 2008-9, a part of the reason for the slowdown lies in global factors, particularly the crisis in the eurozone area and near-recessionary conditions prevailing in Europe; sluggish growth in many other industrialized countries, like the USA; stagnation in Japan; and hardening international prices of crude oil, which always has a large effect on India. Domestic factors, namely the tightening of monetary policy, in particular raising the repo rate in order to control inflation and anchor inflationary expectations, resulted in some slowing down of investment and growth, particularly in the industrial sector. Since monetary policy operates largely through demand compression in the short run, the expectation is that this policy will in fact bolster long-run growth. The 2008-9 downturn came to India when the country's fiscal balances were robust. Hence, there was ample scope for fiscal and monetary stimulus. As in most parts of the world,

this second slowdown is coming so quickly on the heels of the previous one that the latitude that we have in terms of fiscal and monetary policy is much more limited. Evidently, there is need to be innovative in terms of policy.

1.4 Earlier Economic Surveys had highlighted the growing divergence between the two measures of GDP, namely GDP at factor cost at constant prices (production or value-added method) and GDP at constant market prices (demand-side GDP), arising from the global financial crisis and the policy responses which included fiscal stimuli. As per the latest revisions to GDP announced by the CSO in the QE of national income released on 31 January 2012, demand-side GDP is estimated to have grown by only 3.9 per cent in 2008-9 and the recovery in 2009-10 and 2010-11 was sharper at 8.2 per cent and 9.6 per cent respectively (Table 1.2). The revisions indicate that the global crisis in 2008-9 was mainly reflected in negative growth in gross capital formation, with the slowdown in private final consumption expenditure being modest. More importantly, post-crisis growth in gross fixed capital formation has been lukewarm. As per the AE the growth of GDP at market prices is expected to be 7.5 per cent in 2011-12. The growth in real terms of consumption expenditure, gross fixed capital formation, exports and imports respectively works out to 6.0 per cent, 5.6 per cent, 14.3 per cent, and 17.5 per cent for the year 2011-12. The growth in these indicators in 2010-11 was 8.1 per cent, 7.5 per cent, 22.7 per cent, and 15.6 per cent respectively. The rate of growth of private final consumption expenditure in real terms has been fairly consistent and did not decline significantly even when the growth rate was relatively lower, partly due to

the inherent nature of private consumption that does not fluctuate as much as other demand-side components and partly on account of inflationary tendencies, which tend to reduce savings (on account of reduction in real interest rates) rather than affecting the consumption level in the economy.

1.5 The growth rate of investment in the economy is estimated to have registered a significant decline during the current year. The year has been witnessing a sharp increase in interest rates that resulted in higher costs of borrowings; and other rising costs affecting profitability and, thereby, internal accruals that could be used to finance investment. It may also be observed from Table 1.2 that the economy registered high growth in gross capital formation during 2005-6 to 2007-8. As a result, there was rapid increase in investment rate in the economy from 32.8 per cent in 2004-5 to 38.1 per cent in 2007-8 (Table 1.4). The level of investment declined in absolute terms in 2008-9 following the slowdown in the global economy. Though it did recover quickly in 2009-10 and 2010-11, the growth in gross capital formation, particularly fixed capital formation, has been substantially lower than had been achieved in 2005-6 to 2007-8. The investment rate continues to be lower than the peak level achieved in 2007-8.

1.6 Despite difficult conditions in the global economy, exports continued to be robust in the current year and registered a growth rate of 14.3 per cent in real terms over and above 22.7 per cent growth achieved in the previous year (2010-11), as per Advance Estimates. Imports are likely to end the year with a real growth rate of 17.5 per cent as against

15.6 per cent in 2010-11. It may further be noted that international trade (exports and imports) as per national accounts is now around 53 per cent of GDP, up from a level of 37 per cent in 2004-5.

1.7 As stated in paragraph 1.4, the growth rate of private final consumption expenditure has been fairly consistent even when the economy's growth rate has fluctuated somewhat. However, this consistency masks large variations between the various commodity groups as can be seen from Table 1.3. As against an overall growth of private final consumption expenditure that was in the range of 7.1-9.2 per cent during the period 2005-6 to 2010-11, the rates of growth of the consumption groups food, beverages, and tobacco and gross rent, fuel, and power have generally been lower. On the other hand, the growth rates of items like furniture and furnishing, transport and communications, and miscellaneous goods and services have generally been higher. As a result, the composition of private final consumption expenditure in terms of shares underwent changes, as shown in Table 1.3.

SAVINGS AND INVESTMENT

1.8 As per the QE released by the CSO, gross domestic savings as a ratio of GDP at current market prices (savings rate) declined from 33.8 per cent in 2009-10 to 32.3 per cent in 2010-11 (Table 1.4). This decline is accounted for by a reduction in private savings, primarily household savings in financial assets, and somewhat by a reduction in corporate savings. Public savings on the other hand registered an increase, thanks to fiscal consolidation. The

reduction in the financial savings rate of households could be partly attributable to inflationary tendencies in the economy during the period that resulted in

higher growth of private final consumption expenditure than of personal disposable income and partly to a reduction in real interest rate.

Table 1.4 : Ratio of Savings and Investment to GDP (at current market prices per cent)

Note : Totals may not tally due to adjustment for errors and omissions.

1.9 There was a reduction in investment rates, both in the public and private sectors, particularly the corporate sector, in 2010-11. Reduction in corporate investment could be attributed to global factors, with the global economy exhibiting signs of slowing down in the second half of 2010 as well as to domestic factors, namely increased cost of borrowing following the raising of interest rates in order to control inflation. Fixed investment as a ratio of GDP peaked in 2007-8 and has continued to register a decline since then, falling from 31.6 per cent in 2009-10 to 30.4 per cent in 2010-11.

1.10 At 2.8 per cent of GDP, the savings-investment gap during 2010-11 remained at the same level as in 2009-10. This reflected the need to finance the investment requirement from foreign savings (current account deficit). The gap, in excess of 2 per cent of GDP, has been at relatively elevated levels (since 2008-9), as compared to 0.4-1.3 per cent in 2004-5 to 2007-8. The savings-investment gap narrowed both in the public as well as private sectors in 2010-11 vis-à-vis 2009-10. For the public sector, it narrowed from -9.0 per cent of GDP to -7.1 per cent. The gap was much lower in the years prior to 2008-9. However, the fiscal stimulus provided in order to overcome the slowdown of 2008-9 reduced public savings as a ratio of GDP by 4 percentage points in 2008-9 and another 0.8 percentage points in 2009-10. The increase in the revenue levels, thanks partly to substantial increase in non-tax revenue receipts in the year 2010-11, and the process of fiscal consolidation were among the factors responsible for narrowing of the public sector's savings-investment gap.

1.11 In the medium to long term, growth of an emerging economy depends, to a large extent, not only on overall level of investment but also on its sectoral composition reflecting the transformation taking place. However, annual growth rates of investment both at aggregate and sectoral levels may vary, depending on expectations of profitability, sales, etc. As can be seen from Table 1.5, there are large-scale variations in the growth rates of sectors over time. Most of the sectors in 2010-11 registered positive growth in real terms in investment levels except communications and railways. The marginal negative growth in communications in 2009-10 and 2010-11 is not surprising after the very high growth in this sector in the previous two years. The growth in real investment in railways turned negative after showing a positive trend for several years. This partly reflects the inability to raise tariffs in order to meet increasing expenditures.

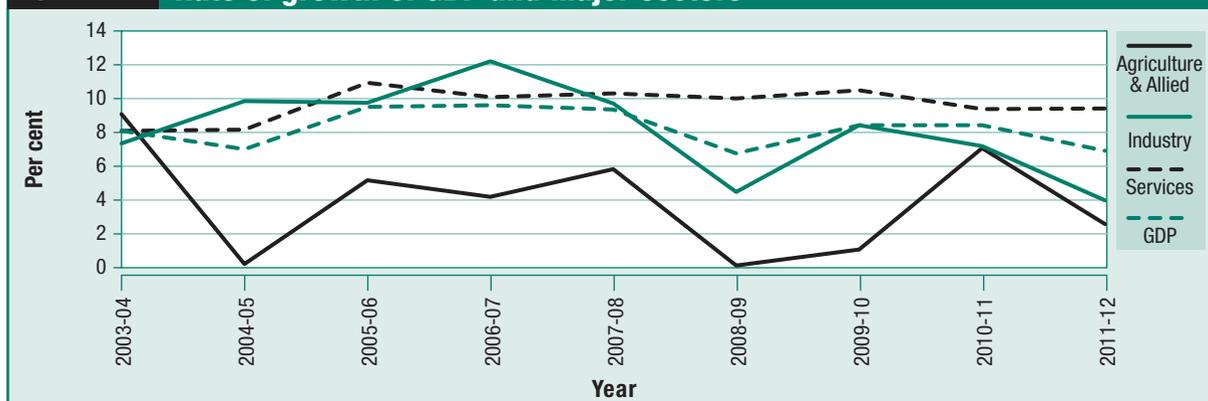

1.12 Typically, the Economic Survey details developments in the current year; however, it is worth commenting on the growth of the Indian economy from the perspective of long-term trends, particularly in the context of the post 1991 period and reflect upon where we are at the current conjuncture. The rate of growth between 1950-1 and 1990-1 was 4.1 per cent. In contrast, between 1991-2 and 2011-12 the economy registered a growth of 6.9 per cent. While in the four decades from 1951-2 to 1991-2, the growth rate in terms of GDP at factor cost (at 2004-5 prices) was more than 6 per cent only in 10 years, between 1992-3 and 2011-12 (including the AE for 2011-12) (a time-span covering 20 years, inclusive of both observations) the growth rate has been over 6 per cent in as many as 14 years. The growth rate has accelerated significantly since 2003-4. Between 2003-4 and 2011-12, the economy registered a growth of 8.2 per cent per annum. In fact, during this period, the growth rate has never fallen below 6.7 per cent and has been over 8 per cent in six of these nine years. All the three major sectors of the economy, namely agriculture, industry, and services witnessed higher-than-trend growth rates at 3.9 per cent, 8.0 per cent, and 9.6 per cent respectively. Clearly the services sector has emerged as the key driver of growth in the Indian economy (see Chapter 10 for a fuller discussion). The growth of this sector has shown the least inter-temporal variations. With the declining share of the agriculture sector and reasonably consistent growth in the services sector, the variations in growth rate of GDP are lately being associated with the variations in the industry sector (Figure 1.1).

1.13 This accelerated growth could partly be attributed to an increase in savings and investment rates, which averaged 33.1 per cent and 34.3 per cent respectively during the period between 2003-4 and 2010-11. The average savings and investment rates in the 1990s were 23.0 per cent and 24.3 per cent respectively. Sustaining and accelerating this growth further could be crucial for attaining higher per capita income and other objectives that aim at enhancing human welfare as reflected by the inclusive development agenda. It may be mentioned that higher growth rate resulted in fairly rapid increase in per capita income. It took nearly 40 years for the real per capita income to double from the level achieved in 1950-1. However, it increased 2.5 times in the next 20 years in the post-reforms period.

Figure 1.1 Rate of growth of GDP and major sectors

1.14 The contributions of the agriculture and allied sector, industry sector, and services sector also underwent significant changes overtime. The long-term growth rate of the agriculture sector (over the last 60 years) has been 2.7 per cent. It was 2.3 per cent between 1950-1 and 1980-1 and 3.1 per cent during 1980-1 to 2011-12. Growth in the industry sector increased from 5.2 per cent in the earlier period to 6.4 per cent between 1980-1 and 2011-12. Similarly growth in the services sector was 4.4 per cent and 7.8 per cent respectively during these two sub-periods.

1.15 The structure of the economy has also undergone significant changes over time. Between 1950-1 and 1980-1, the industrial sector registered a higher growth rate than the services sector. The converse has been the case since then. This resulted in the share of the industry sector in GDP increasing by around 9 percentage points from 16.6 per cent to 25.9 per cent during the period from 1950-1 to 1980-1. The share of the services sector increased from 30.3 per cent in 1950-1 to 38 per cent in 1980-1. It started growing rapidly thereafter and this phenomenon became more pronounced in the 1990s. Consequently, since 1980-1, the share of the industry sector has remained in the range of 26 to 28 per cent of GDP, while the entire decline in share of agriculture has been balanced by an increase in share of the services sector. Thus, the resilience of the economy to shocks owe to the services sector which has the largest share and most consistent growth performance. The changes in relative shares of these sectors in GDP are shown in the Table 1.6.

Table 1.6 Sectoral Composition of GDP

Year	Agriculture	Industry	Services
1950-51	53.1	16.6	30.3
1960-61	48.7	20.5	30.8
1970-71	42.3	24.0	33.8
1980-81	36.1	25.9	38.0
1990-91	29.6	27.7	42.7
2000-01	22.3	27.3	50.4
2010-11 ^{OE}	14.5	27.8	57.7
2011-12 ^{AE}	13.9	27.0	59.0

QUARTERLY ESTIMATES FOR GDP

1.16 The CSO released the estimates for the third quarter of the year 2011-12 on 29 February 2012. Table 1.7 gives the quarterly growth rates of GDP and major sectors for the first three quarters of 2010-11 and 2011-12.

1.17 The growth rate in the third quarter of the current year in terms of GDP at factor cost has been 6.1 per cent. The growth of agriculture, industry, and services sectors works out to be 2.7 per cent, 2.6 per cent, and 8.9 per cent respectively as against 11.0 per cent, 7.6 per cent, and 7.7 per cent respectively in the year 2010-11. It may be seen that growth in each of the successive quarters of the current year has been lower than in the preceding one. Growth in the first three quarters put together in the current year works out to 6.9 per cent as against 8.1 per cent in the corresponding period last year. The industry and agriculture sectors slowed

Table 1.7 : Quarterly Growth Rate for first three quarters (per cent)

Sector	2010-11			2011-12		
	Q1	Q2	Q3	Q1	Q2	Q3
1 Agriculture, forestry & fishing	3.1	4.9	11.0	3.9	3.2	2.7
Industry	8.3	5.7	7.6	5.1	3.2	2.6
2 Mining & quarrying	6.9	7.3	6.1	1.8	-2.9	-3.1
3 Manufacturing	9.1	6.1	7.8	7.2	2.7	0.4
4 Electricity, gas & water supply	2.9	0.3	3.8	7.9	9.8	9.0
5 Construction	8.4	6.0	8.7	1.2	4.3	7.2
Services	10.0	9.1	7.7	10.0	9.3	8.9
6 Trade, hotels, transport & communication	12.7	10.8	9.8	12.8	9.9	9.2
7 Financing, insurance, real estate & business services	10.0	10.4	11.2	9.1	10.5	9.0
8 Community, social & personal services	4.4	4.5	-0.1	5.6	6.6	7.9
Total GDP at factor cost	8.5	7.6	8.3	7.7	6.9	6.1

Source: CSO

down to 3.6 per cent and 3.2 per cent respectively, while the services sector has improved its growth to 9.4 per cent. The growth rate of GDP at constant market prices in the first three quarters of the current year has been 7.1 per cent.

AGRICULTURE AND FOOD

1.18 Agriculture including allied activities accounted for 13.9 per cent of GDP at 2004-5 prices in 2011-12 as compared to 14.5 per cent in 2010-11. In terms of composition, out of a total share of 14.5 per cent in GDP in 2010-11, agriculture alone accounted for 12.3 per cent, followed by forestry and logging at 1.4 per cent, and fishing at 0.7 per cent. Notwithstanding the declining trend in agriculture's share in GDP, the importance of the sector to the economy is best understood with reference to its share in employment and in terms of its criticality for macroeconomic stability. While the former was well known, the latter became manifest with rising growth in incomes since the mid-2000s.

1.19 Hence, growth in agriculture and allied sectors remains an important objective and a 'necessary condition' for inclusive growth. The average annual growth in agriculture and allied sectors realized during the Eleventh Plan Period was 3.3 per cent against the targeted growth rate of 4 per cent. The sector recorded slightly lower average growth than targeted in the Eleventh Plan period due to severe drought experienced in most parts of the country during 2009-10 and drought/deficient rainfall in some states, namely Bihar, Jharkhand, eastern UP, and West Bengal in 2010-11. However, timely and corrective measures taken by the government helped boost agricultural production and growth in the sector reached 7.0 per cent in 2010-11, the highest growth rate achieved during the last six years. In 2011-12 agriculture and allied sectors are estimated to achieve a growth rate of 2.5 per cent. However, it is a matter of concern that agricultural growth is still, to a certain extent, characterized by fluctuations due to the vagaries of nature, though there has not been actual decline in terms of output since 2002-3.

1.20 Rainfall continues to influence crop production and productivity in a substantial way. During the south-west monsoon season, which accounts for the bulk of rainfall in the country, rainfall was 1 per cent more than the long period average (LPA) in

2011. In terms of spatial distribution, rainfall during this season was most conducive for augmenting agricultural output this year.

1.21 In 2010-11 a significantly high level of 244.78 million tonnes of foodgrains production was achieved. As per the second AE, production of foodgrains during 2011-12 has been estimated at 250.42 million tonnes owing to increase in the production of rice in some of the major rice-producing states of the country, namely Assam, Bihar, West Bengal, Jharkhand, and Uttar Pradesh.

1.22 The stock position of foodgrains in the central pool as on 1 February 2012 was 55.2 million tonnes, comprising 31.8 million tonnes of rice and 23.4 million tonnes of wheat, which is adequate for meeting the requirements under the targeted public distribution system (TPDS) and welfare schemes during the current financial year. The higher levels of agricultural output and ample food stocks augur well for bringing down headline inflation.

INDUSTRY AND INFRASTRUCTURE

1.23 Industrial growth, measured in terms of the index of industrial production (IIP), shows fluctuating trends. Growth had reached 15.5 per cent in 2007-8 and then started decelerating. Initial deceleration in industrial growth was largely on account of the global economic meltdown. There was, however, a recovery from 2.5 per cent in 2008-9 to 5.3 per cent in 2009-10 and 8.2 per cent in 2010-11. Fragile economic recovery in the US and Europe and moderately subdued expectations at home affected the growth of the industrial sector in the current year. Overall growth during April-December 2011 reached 3.6 per cent compared to 8.3 per cent in the corresponding period of the previous year.

1.24 There was a contraction in production in the mining sector, particularly the coal and natural gas segments. Contraction in output also resulted in its contribution to growth turning negative. The electricity sector witnessed an improvement in growth in the current year. This sector contributed 22.6 per cent to overall industrial growth, which was more than twice its weight in the IIP. Growth moderated in the manufacturing sector, from 9.0 per cent in April-December 2010 to 3.9 per cent in April-December 2011, which, given its large share in the IIP, led to a slowdown in the industry sector as a whole.

1.25 In terms of use-based classification of the IIP, in the current year (April-December), basic goods with a growth of 6.1 per cent and consumer non-durables with a growth of 6.1 per cent had relatively better growth compared to the corresponding period of the previous year. There was moderation in growth in other segments of the IIP and negative growth was observed in capital goods and intermediates. Contribution of basic goods segment to overall IIP growth at 65.7 per cent not only exceeded its weight in the IIP, but was also the highest. Contribution of consumer non-durables at 28.1 per cent also exceeded its weight in the IIP.

1.26 Within the manufacturing sector, the IIP separately provides growth rates for 22 sub-groups, disaggregated at two-digit level of the National Industrial Classification (NIC-2004). Growth varied across the sub-groups indicating that, while in terms of broad classification the slowdown might appear pervasive, there were segments that did well. In April-December 2011, there were 7 manufacturing sub-groups with a weight of 29.23 per cent in the IIP that recorded growth in excess of 10 per cent; 9 sub-groups with a weight of 26.6 per cent that had positive but below 10 per cent growth; and 6 sub groups with a weight of 19.7 per cent that had negative growth. Though in the current year sub-groups which recorded double-digit growth increased in terms of relative importance, a sharper moderation in other sectors resulted in a deceleration in aggregate growth.

1.27 Corporate-sector sales are another indicator of industrial performance. Abridged financial results of the listed manufacturing companies indicate robust sales growth (in nominal terms) during 2011-12. In the first three quarters of the current year, sales growth has varied between 20 and 25 per cent. Sales growth has moderated from a peak of 34.9 per cent in fourth quarter of 2009-10 to 22.6 per cent in the third quarter of the current financial year. However, it is better than the 19.0 per cent growth in the same period of the previous year. Expenditure growth, however, outpaced revenue growth, leading to lower growth in net profits, which declined in the latest two quarters. Higher expenditure growth was initially led by high raw material expenses, but interest expenses increased more sharply in the second and third quarters of 2011-12.

1.28 Production in eight core industries grew by 0.5 per cent in January 2012 as compared to 6.4 per cent in January 2012. Cumulative growth in April-

January 2011-12 has been 4.1 per cent as compared to 5.7 per cent during the corresponding period of the previous year. While four sectors, namely coal, fertilizers, cement, and electricity, showed positive growth during January 2012 other four sectors, i.e. crude oil, natural gas, refinery products and steel, registered negative growth. Though the cumulative growth of coal during the current year so far continues to be negative, there has been an increase in production in the last three months. Output in the cement sector has also shown a double digit growth in last three months (November-January 2011-12).

1.29 The Ministry of Statistics and Programme Implementation (MOSPI) has been monitoring the progress of all central-sector projects costing Rs 150 crore and above. The flash report for the month of October 2011 tracks the progress of 583 projects in different sectors. Of these, only 7 are ahead of schedule, 166 are on schedule, and 235 are delayed (175 projects were sanctioned without specifying any commissioning schedule). The delays also imply a cost overrun of 15.3 per cent. The maximum number of projects delayed belong to road transport and highways (90), followed by power (45), petroleum (29), railways (26), and coal (17). As is evident from national accounts as well as IIP data, the electricity sector is doing well this year.

1.30 Electricity generation by power utilities during 2011-12 was targeted to grow by 5.4 per cent to reach 855 billion units. Growth in power generation during April-January 2011-12 was 8.6 per cent as compared to 5.2 per cent during April-January 2010-11. In the first nine months of 2011, 76 per cent of the generation target had been achieved. The overall plant load factor (PLF), a measure of efficiency of thermal power stations, at 72.1 per cent during April-December 2011 was marginally lower than the PLF of 72.9 per cent achieved during April-December 2010. The PLF in the current year, however, exceeded the target of 68.2 per cent for the first three quarters. During the current financial year, production of crude oil is estimated at 38.19 million metric tonnes (MMT), which is about 1.33 per cent higher than the 37.70 MMT produced during 2010-11. Domestic crude oil production during April-December 2011-12 was 28.70 MMT, showing a growth of 1.9 per cent over the same period of the previous year. Non-coking coal accounts for more than 90 per cent of coal production in India. The lower growth in production during the current year and last year is primarily due to environmental

restrictions, application of the comprehensive environmental pollution index (CEPI), non-availability of forestry clearance against some of the projects, poor law and order situation some of the states and excessive rainfall in the coal-mining areas. Lower domestic production increased dependency on imports and consequently 68.9 MT of coal was imported in 2010-11.

1.31 Freight loading on Indian Railways was 618.0 MT during April-November 2011 as compared to 593.4 MT in April-November 2010, registering an increase of 4.14 per cent. This was 26.6 MT short of the proportionate target of 644.6 MT. The low growth was primarily on account of relatively slow growth in core sectors of the economy. This was compounded by negative growth in iron ore after the imposition of a ban on export of iron ore in Karnataka and procedural problems in obtaining clearance from state governments. Air traffic in India continues to register significantly higher rates of growth, averaging 18.5 per cent in the last seven years. Domestic passenger traffic handled at Indian airports reached 108.1 million during January-November 2011 from a level of 90.5 million in the corresponding period of the previous year, registering a growth of 19.4 per cent. International passenger traffic and cargo handled at Indian airports grew by 7.7 per cent during January-November 2011 and was placed at 33.6 million passengers and 1.4 MMT of cargo. Domestic cargo throughput during the period January-November 2011 stood at 0.75 MMT, the same level as in the previous year.

1.32 The telecom sector continues to grow, with the total number of telephones increasing from 206.8 million on 31 March 2007 to 926.95 million on 31 December 2011. Tele-density is an important indicator of telecom penetration in the country. It has increased from 18.2 per cent in March 2007 to 76.8 per cent in December 2011. Tele-density varies across circles and there is significant urban-rural divide. While it reached 167.4 per cent in the urban areas at the end of December 2011, rural tele-density was only 37.5 per cent. In the ports sector, major and non-major ports in India handled a total cargo throughput of 446.1 MT during April-September 2011, reflecting an increase of 4.6 per cent over the same period last year. The rate of growth of cargo handled at 12 major ports improved from 1.2 per cent in April-September 2010 to 3.1 per cent in April-September 2011. There was, however, a deceleration in the growth of cargo

handled at non-major ports, from 22.2 per cent in April-September 2010 to 7.2 per cent in April-September 2011.

SERVICES SECTOR

1.33 The share of services in India's GDP at factor cost (at current prices) increased from 33.5 per cent in 1950-1 to 55.1 per cent in 2010-11 and 56.3 per cent in 2011-12 as per Advance Estimates. Trade, hotels, and restaurants as a group, with 16.9 per cent share, is the largest contributor to GDP among the various services sub-sectors, followed by financing, insurance, real estate, and business services with 16.4 per cent share. The services-sector growth rate at constant prices has always been above the overall GDP growth rate since 1996-7 except for 2003-4. The compound annual growth rate (CAGR) of the services sector at 10.2 per cent for the period 2004-5 to 2010-11 has been higher than the 8.6 per cent GDP growth rate during the same period. In the years 2009-10 and 2010-11, the services sector registered a growth rate of 10.5 per cent and 9.3 per cent respectively. In 2011-12, as per the Advance Estimates, the growth rate of services has been placed at 9.4 per cent.

1.34 While agriculture continues to be the primary employment-providing sector, the services sector is the principal source of employment in urban areas. As per the National Sample Survey Organization's (NSSO) report on the 'Employment and Unemployment Situation in India, 2009-10', for every 1,000 people employed, 679 and 75 people are employed in agriculture sector in rural and urban areas respectively (measured in terms of usually working persons in the principal status and subsidiary status). On the other hand, the services sector accounted for 147 and 582 of every 1,000 persons employed in rural and urban areas respectively.

PRICES

1.35 Headline WPI inflation remained persistently high and relatively sticky at around 9 per cent during 2011. Though inflation remained high throughout the year, it has shown signs of moderation lately. One such indicator of the trend is the seasonally adjusted three-month moving average data in all the major groups of the WPI (Figure 1.2). The financial year 2011-12 started with a headline

inflation of 9.7 per cent, which briefly touched double digits in September 2011 before declining to 6.6 per cent in January 2012. Consumer price index (CPI) inflation for the major indices declined to below 7 per cent in December 2011.

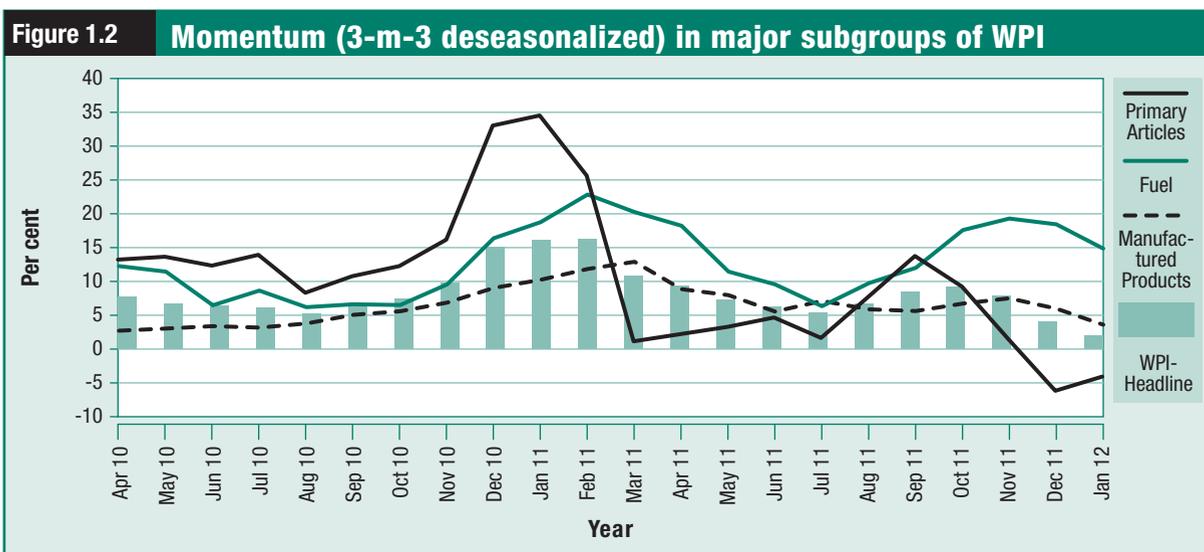

1.36 The major contributory factors to headline inflation during the current financial year include (a) higher primary articles prices driven by vegetables, eggs, meat, and fish due to changing dietary pattern of consumers; (b) increasing global commodity prices especially metal and chemical prices which ultimately led to higher domestic manufactured prices; and (c) persistently high international (Brent) crude petroleum prices in the last two years averaging around \$ 111 per barrel (/bbl) in 2011 (January-December) as compared to \$ 80/bbl in 2010 (January-December).

1.37 Compared to a relatively stable inflationary period in the earlier part of the last decade, average headline WPI inflation started to rise in 2008-9 and persisted. The pressure was mainly from primary and fuel products with average inflation in these commodities remaining continuously in double digits for a major period since 2008-9. In comparison, inflation in manufactured products remained relatively stable, dropping sharply in 2009-10 because of the global economic crisis and its impact in India, before it started to pick up and exceed its long-run average of around 5 per cent in early 2011-12. Among individual product groups, inflation in food products, beverages, textiles, chemicals, and basic metals remained elevated mainly on account of high global commodity prices.

1.38 WPI food inflation (weight 24.31 per cent) has significantly dropped from 20.2 per cent in February 2010 to 1.6 per cent in January 2012 mainly on the back of seasonal fall in fruit and vegetable prices and good harvest leading to lower inflation in cereals. The major drivers of food inflation during the current financial year were milk, eggs/ meat/ fish, gram, and edible oils. In comparison with last year when cereals, vegetables, and sugar were the main contributors to food inflation, the year 2011-12 witnessed higher contribution from manufactured food products, especially edible oils, due to higher global prices soyabean oil, palm oil, etc.

1.39 In the current financial year (2011-12), the gap between WPI and CPI inflation has significantly narrowed due to a fall in food inflation. Inflation based on CPI for industrial workers (IW), after remaining in single digit from August 2010 to August 2011, briefly touched double digits at 10.1 per cent in September 2011 before coming down to 5.3 per cent in January 2012. Food inflation for CPI-IW was 0.5 per cent in January 2012. WPI food articles (weight 14.34 per cent) inflation turned negative in January 2012.

1.40 The year-on-year inflation released recently by the CSO for CPI (urban), CPI (rural), and CPI (combined) was 8.25 per cent, 7.38 per cent, and 7.65 per cent respectively in January 2012. While a strict comparison is not possible, the inflation rate for CPI (rural) (7.38 per cent) released by the CSO for January 2012 is reported to be higher than CPI (rural labour) (5.27 per cent) released by the Labour Bureau, Chandigarh due to differences in coverage and weighting (consumption) patterns.

MONETARY MANAGEMENT

1.41 Reining in inflation and containing inflationary expectations were the dominating objectives of monetary policy during 2011-12. The RBI hiked the repo rate 13 times between March 2010 and January 2012, cumulatively by 375 basis points (bps). With supply-side factors feeding into food inflation and an uncertain economic scenario in advanced countries necessitating repeated liquidity injections by these countries to counter recessionary trends, the task of monetary policy calibration was particularly challenging. Sustained rate increases have, to an extent, impacted growth negatively. However, the period from December 2011 to January 2012 marked a reversal of the cycle with the RBI in its Third Quarter Review of Monetary Policy keeping the repo and reverse repo rates unchanged at 8.5 per cent and 7.5 per cent respectively. The cash reserve ratio (CRR), however, has been reduced from 6.0 to 5.5 per cent in order to ease the liquidity situation and aid revival of growth.

1.42 Significant changes in the operating procedure of monetary policy have been effected with the weighted average overnight call money rate made the operating target and the repo rate specified as the only independently varying policy rate. A new marginal standing facility (MSF) has been instituted under which scheduled commercial banks (SCBs) have been allowed to borrow overnight at their discretion, up to 1 per cent of their respective net demand and time liabilities (NDTL), at 100 bps above the repo rate. The revised corridor has been defined with a fixed width of 200 bps and the repo rate placed in the middle of the corridor and reverse repo rate at 100 bps below it. The RBI, as a one-time technical adjustment on 13 February 2012, has further aligned the bank rate with the MSF rate of 9.5 per cent.

1.43 During 2011-12, the growth rate in reserve money (M_0) has been 1.9 per cent (as on 10 February 2012) while broad money (M_3) growth has been 10.2 per cent (as on 27 January 2012). Year-on-year, non-food credit growth was 15.7 per cent at the end of December 2011. Liquidity conditions have generally remained in deficit during 2011-12, with the fiscal starting off with the liquidity adjustment facility (LAF) in absorption mode for a brief period, followed by reversion to deficit mode from April 2011. Some stress on liquidity emerged during June 2011 on account of quarterly advance tax outflows. The stress eased in July 2011 with, inter alia, redemption of a

security amounting to around ₹ 37,000 crore. During the first half of 2011-12, the injection of liquidity under the MSF was limited to two occasions. Liquidity continued to be in deficit mode during November and December 2011, persisting up to January 2012. During 2011-12, the RBI addressed liquidity concerns via the use of standard tools, namely open market operation (OMO) purchases and measures including additional repo operations under the LAF in December 2011; and permitting banks to avail of funds on overnight basis under the MSF (against their excess statutory liquidity ratio [SLR] holdings) in addition to the existing facility that allows access to funds up to 1 per cent of their respective NDTL. To ease tightness in liquidity the RBI conducted OMOs aggregating over ₹ 70,000 crore over the period November 2011 to mid-January 2012.

FINANCIAL INTERMEDIATION AND MARKETS

1.44 The weak global economic prospects and continuing uncertainties in the international financial markets have had their impact on emerging market economies like India. Sovereign risk concerns, particularly in the euro area, affected financial markets for the greater part of the year, with the impact of Greece's sovereign debt problem spreading to India and other economies by way of higher-than-normal levels of volatility. The funding constraints in international financial markets could impact both the availability and cost of foreign funding for banks and companies, since the Indian financial system is bank dominated and banks' ability to withstand stress is critical to overall financial stability. Indian banks however remain robust, notwithstanding a decline in the capital to risk weighted assets ratio and spurt in non-performing asset levels in the recent past. Capital adequacy levels remain above the regulatory requirements.

1.45 Keeping in view progressive deregulation of interest rates, savings bank account interest rates were deregulated with effect from 25 October 2011, wherein banks will have to keep a uniform rate of interest for savings accounts with deposits up to ₹ 1 lakh, while differential interest rates could be set for savings deposits over ₹ 1 lakh. The deregulation is expected to improve the transmission of monetary policy. It is also expected to enhance the attractiveness of savings accounts and encourage thrift behaviour in the economy by bringing savings

deposit rates in sync with changing market conditions.

1.46 Subdued foreign institutional investor (FII) inflows into the country led to a decline in Indian markets and contributed to the sharp depreciation of the rupee in the forex market, though much of the depreciation was due to 'flight to safety' by foreign investors, given the meltdown in Europe and inflation in emerging market economies. Moderation in the growth rate of the economy has also affected market sentiments. This moderation in growth is on account of several factors, including uncertainty in the global environment and the lag effect of monetary policy tightening. Qualified foreign investors (QFIs) were allowed to directly invest in Indian equity markets in January 2012. This was done to widen the class of investors, attract more foreign funds, reduce market volatility, and deepen the Indian capital market. Earlier, only FIIs/sub-accounts and non-resident Indians (NRIs) were allowed to directly invest in Indian equity markets.

1.47 In November 2011, the external commercial borrowings (ECB) policy was modified keeping in view developments in the global financial markets and macroeconomic conditions. The all-in-cost ceiling was enhanced and the proceeds of the ECBs raised abroad for rupee expenditure in India were required to be brought back immediately. The change in the all-in-cost ceiling came into force immediately and is applicable up to 31 March 2012, subject to review thereafter. Infrastructure development is key to long-term sustainable growth of the economy. However, infrastructure finance remains a constraining factor with heavy dependence on bank financing. Development of the corporate bond market is important for infrastructure development. While the introduction of credit default swaps is expected to help in the process, innovative steps are needed to make the corporate bond market a major component of infrastructure financing.

INTERNATIONAL TRADE

1.48 The resilience of India's trade can be seen from the fact that the growth of exports and imports, which was (-)3.5 per cent and (-)5 per cent respectively in 2009-10 as a result of the 2008 global economic crisis, rebounded to 40.5 per cent and 28.2 per cent in 2010-11. India not only reached

pre-crisis levels in exports but also surpassed pre-crisis trends in export growth rate, unlike many other developing and even developed countries. India's share in global exports and imports also increased from 0.7 per cent and 0.8 per cent respectively in 2000 to 1.5 per cent and 2.2 per cent in 2010 (1.4 and 2.1 per cent as per the World Trade Organization [WTO]).

1.49 During the first half of 2011-12, India's exports witnessed a high growth of 40.6 per cent. However, since October 2011 there has been a deceleration as a result of the crisis originating in the periphery and spreading to the core economies in the euro area. In November 2011, export growth was at (-) 0.5 per cent and in December 2011 and January 2012, it was positive but low at 6.7 per cent and 10.1 per cent respectively. Cumulative exports were at US \$242.8 billion, registering a growth of 23.5 per cent during 2011-12 (April-January). During April-December 2011, the export sectors that have done well are petroleum and oil products, gems and jewellery, engineering goods, cotton fabrics, made ups, electronics, readymade garments, and drugs.

1.50 Imports in 2011-12 (April-January) at US\$391.5 billion registered a growth of 29.4 per cent. During this period, POL imports at US \$ 118 billion grew by 38.8 per cent. Non-POL imports at US \$ 273.5 billion grew by 25.7 per cent. Gold and silver imports of US \$ 50 billion grew by 46.2 per cent. Non-POL and non-bullion imports, which basically reflect the imports of capital goods needed for industrial activity and imports needed for exports, valued at US \$ 223 billion grew by 21.7 per cent. Trade deficit (on customs basis) increased by 8.2 per cent to US\$ 118.6 billion in 2010-11 from US\$ 109.6 billion in 2009-10. However, trade deficit for 2011-12 (April-January) at US \$ 148.7 billion was 40.4 per cent higher than the US \$ 105.9 billion in 2010-11 (April-January).

1.51 India has made progress in diversifying its export and import markets. The share of Asia and the Association of South East Asian Nations (ASEAN) in total trade increased from 33.3 per cent in 2000-1 to 57.3 per cent in the first half of 2011-12, while that of Europe and America fell from 26.8 per cent to 19 per cent. This has helped India weather the global crisis emanating from Europe and America. The USA has been displaced by the UAE as India's largest trading partner, followed by China, since 2008-9.

BALANCE OF PAYMENTS (BoP)

1.52 The highlight of BoP developments during 2011-12 was merchandise exports of US\$ 150.9 billion in the first half of the year, which represented an increase of over 40 per cent over the corresponding period in 2010-11. Imports of US\$ 236.7 billion during April-September 2011 recorded an increase of 34.3 per cent over April-September 2010. The trade deficit was higher at US\$ 85.8 billion (9.4 per cent of GDP) during the first half of 2011-12 vis-à-vis US\$ 68.9 billion (8.9 per cent of GDP) in the first half of 2010-11. This was mainly on account of increase in international prices of imported commodities, namely oil and gold and silver during the first half of 2011-12.

1.53 The net invisibles surplus of US\$ 52.9 billion (5.8 per cent of GDP) during the first half of 2011-12 was higher vis-à-vis US\$ 39.3 billion (5.1 per cent of GDP) during April-September 2010. All broad categories of invisibles, that is services, transfers, and income, showed increase during the first half of 2011-12. The current account deficit increased to US\$ 32.8 billion in the first half of 2011-12, as compared to US\$ 29.6 billion during the corresponding period of 2010-11, which was mainly attributed to higher trade deficit.

1.54 Net capital flows at US\$ 41.1 billion in the first half of 2011-12 remained higher as compared to US\$ 38.9 billion in the first half of 2010-11. Under net capital flows, foreign direct investment (FDI) has shown considerable increase at US\$ 12.3 billion during the first half of 2011-12 vis-à-vis US\$ 7.0 billion in the corresponding period of 2010-11. Similarly, ECBs increased to US\$ 10.6 billion during the first half of 2011-12 as against US\$ 5.7 billion in the first half of 2010-11. Portfolio investment, mainly comprising FII investments and American depository receipts (ADRs)/global depository receipts (GDRs), however, witnessed large decrease in inflows to US\$ 1.3 billion in the first half of 2011-12 vis-à-vis US\$ 23.8 billion in the first half of 2010-11. However, net capital inflows as a proportion of GDP have shown moderation from 5.0 per cent in the first half of 2010-11 to 4.5 per cent in the first half of 2011-12. Net accretion to reserves (on BoP basis) during the first half of 2011-12 was lower at US\$ 5.7 billion as compared to US\$ 7.0 billion in the first half of the previous year mainly due to widening of the current account deficit.

FOREIGN EXCHANGE RESERVES

1.55 In fiscal 2010-11, foreign exchange reserves increased by US\$ 25.7 billion from US\$ 279.1 billion at end March 2010 to US\$ 304.8 billion at end March 2011. Of the total increase in reserves, US\$ 12.6 billion was on account of valuation gains arising out of depreciation of the US dollar against major currencies and the balance US\$ 13.1 billion was on BoP basis. In 2011-12, the reserves increased by US\$ 6.7 billion from US\$ 304.8 billion at end March 2011 to US\$ 311.5 billion at end September 2011. Out of this total increase, US\$ 5.7 billion was on BoP basis and the balance US\$ 1.0 billion on account of valuation effect.

1.56 In the current fiscal, foreign exchange reserves rose and then declined. The reserves reached an all-time high of US\$ 322.0 billion at end August 2011. However, they declined to US\$ 311.5 billion at end September 2011. At end December 2011, reserves stood at US\$ 296.7 billion and at end January 2012 at US\$ 292.8 billion, indicating a decline of US\$ 12.0 billion from US\$ 304.8 billion at end March 2011. The decline in reserves is partly due to intervention by the RBI to stem the slide of the rupee against the US dollar.

EXCHANGE RATE

1.57 In the current fiscal, on month-to-month basis the rupee depreciated by 12.4 per cent from ₹ 44.97 per US dollar in March 2011 to ₹ 51.34 per US dollar in January 2012. On point-to-point basis, it depreciated by 16.2 per cent from ₹ 44.65 per US dollar on 31 March 2011 to ₹ 53.26 per US dollar on 30 December 2011. The rupee reached a peak of ₹ 43.94 on 27 July 2011 and a low of ₹ 54.23 per US dollar on 15 December 2011, indicating a depreciation of 19.0 per cent. Similarly, the monthly average exchange rate of the rupee depreciated by 11.5 per cent against the pound sterling, 9.1 per cent against the euro, and 18.7 per cent against the Japanese yen between March 2011 and December 2011.

EXTERNAL DEBT

1.58 India's external debt stock stood at US\$ 326.6 billion at end-September 2011, recording an increase of US\$ 20.2 billion (6.6 per cent) over end March 2011 estimates of US\$ 306.4 billion. This increase was primarily on account of higher commercial

borrowings and short-term debt, which together contributed over 80 per cent of the total increase in the country's external debt.

1.59 The maturity profile of India's external debt indicates the dominance of long-term borrowings. The long-term external debt at US\$ 255.1 billion at end September 2011 accounted for 78.1 per cent of the total external debt, while the remaining 21.9 per cent was short-term debt. Government (sovereign) external debt stood at US\$ 79.3 billion, while non-government debt amounted to US\$ 247.3 billion at end September 2011. India's external debt has remained within manageable limits as indicated by the external debt to GDP ratio of 17.8 per cent and debt service ratio of 4.2 per cent in 2010-11. This has been possible due to an external debt management policy of the government that emphasizes monitoring of long- and short-term debt, raising sovereign loans on concessional terms with long maturities, regulating ECBs through end-use and all-in-cost restrictions, and rationalizing interest rates on NRI deposits.

FISCAL DEVELOPMENTS

1.60 Following two years of purposeful fiscal expansion, the Budget for 2010-11 resumed fiscal consolidation with a partial rollback of the stimulus. The outcome was substantial, with fiscal deficit declining to 4.8 per cent of GDP in 2010-11 from 6.5 per cent in 2009-10. The Budget for 2011-12 sought to carry forward the process of fiscal consolidation through a reduction in the fiscal deficit to 4.6 per cent of GDP. The Medium Term Fiscal Policy Statement indicated that this would be further continued, underscoring the commitment to fiscal consolidation for sustaining macroeconomic outcomes.

1.61 Economic Surveys 2009-10 and 2010-11 had analysed in some detail the macroeconomic dimensions of the fiscal stimuli to counteract the adverse impact of the global financial and economic crisis, using national accounts data. The recent revisions to GDP data indicate that demand slowdown in 2008-9 was sharper and GDP at constant market prices was placed at 3.9 per cent in 2008-9. This consisted of a contraction of 1.6 per cent in gross capital formation and deceleration in private final consumption expenditure. The fiscal expansion was manifest in growth of over 10 per cent and 14 per cent in government final

consumption expenditure and 12.3 per cent and 4.5 per cent in capital formation by government in 2008-9 and 2009-10 in terms of constant 2004-5 prices. Besides, growth in indirect taxes minus subsidies, after declining to 14.7 per cent in 2008-9 and 10.4 per cent in 2009-10, rose to 28.7 per cent in 2010-11. The macroeconomic outcome of this expansion was the sharp rebound in growth of demand-side GDP (at constant market prices) to 8.2 per cent in 2009-10 and 9.6 per cent in 2010-11 from 3.9 per cent in 2008-9. This level of rebound was among the swiftest and highest in the global economy.

1.62 Globally, it might be recalled that most advanced economies had very little monetary space for responding to the crisis and sought recourse to fiscal policies to ease the recessionary tendencies. The Update of Fiscal Monitor of the International Monetary Fund (IMF) for January 2012 documents the extent of fiscal expansion around the world. The overall fiscal deficit went up from 2.0 per cent of GDP in 2008 to 6.7 per cent in 2009 following the large fiscal stimulus the world over to alleviate the adverse impact of the global financial and economic crisis. After declining to 5.5 per cent of GDP in 2010, the fiscal deficit is projected to fall to 4.5 per cent in 2011 and 4.1 per cent in 2012.

1.63 Advanced economies as a group had larger deficits in both the pre-crisis and post-crisis periods according to the Update of Fiscal Monitor. While the fiscal deficit of advanced economies was 7.6 per cent of GDP in 2010 and projected to be 6.6 per cent in 2011; that of emerging market economies is placed at 3.6 per cent and 2.6 per cent respectively for these years. Among the major emerging economies, India's fiscal deficit at 8.9 per cent in 2010 and estimated level of 8.5 per cent in 2011 was among the highest. The projections firmly indicate that fiscal consolidation is taking place across nations since 2010. In India's case, the Monitor indicates that a larger correction is needed in terms of key fiscal indicators. It also projects the average interest rate-growth differential to be -5.1 per cent for the period 2011-16, which would enable favourable dynamics in terms of the debt-GDP ratio. The fiscal outcome in 2010-11 in India partly reflected that unique advantage in terms of a better-than-estimated reduction in debt-GDP ratio on account of this differential as well as the substantial fiscal correction arising from the higher level of nominal GDP. As a proportion of GDP, fiscal deficit of the central government fell from 6.5 per cent in 2009-10 to

4.8 per cent in 2010-11. With fiscal deficit of the states declining from 2.9 per cent of GDP in 2009-10 to 2.7 per cent in 2010-11, general government deficit declined to 7.9 per cent of GDP in 2010-11 from 9.4 per cent in 2009-10.

1.64 With the AE released in February 2011 indicating growth in real GDP at market prices to be 9.6 per cent in 2010-11, though there was some concern about industrial slowdown, the macroeconomic outlook at the time of the presentation of the Budget for 2011-12 was positive and supportive of the process of fiscal consolidation. However, as the year progressed the industrial downturn got prolonged and the persistence of inflationary pressures and monetary tightening led to a sharper demand slowdown. This had its impact on public finances with rising costs impairing profit margins and thereby affecting level of growth in corporate income tax and central excise. The higher outgo in terms of tax refunds, the lower levels of non-tax revenues and the state of the equities market that was inappropriate for achieving the planned disinvestment in the first nine months of the current fiscal have made the task of achieving the budgeted revenues in the current fiscal quite challenging. Global crude petroleum prices remained high and, given limited flexibility in domestic price setting, there has been some additional expenditure with implications for the levels of deficit – both revenue and fiscal. This is reflected in the Union Accounts data made available by the Controller General of Accounts for April-December 2011.

1.65 Union public finances are under some stress with revenue deficit at 93.1 per cent of the Budget Estimates (BE) and fiscal deficit at 92.3 per cent of BE in April-December 2011. In the first nine months, gross tax revenue has grown at a rate which is 5 percentage points lower than the year-on-year growth envisaged in BE 2011-12 over provisional actuals of 2010-11. This has been mainly due to lower growth in corporation taxes at 6 per cent as against the 20.2 per cent envisaged by BE 2011-12, partly attributable to the higher levels of refunds this year and a much-lower-than-targeted growth in excise duties. Given that there was a sizeable hike in expenditure in 2010-11, which was largely made possible by the higher-than-estimated receipts under non-tax revenues, the Budget for 2011-12 estimated a growth target of 4.9 per cent for total expenditure for the full year. Growth in total expenditure in the first nine months of 2011-12 was 13.9 per cent, which

comprised a growth of 15.4 per cent in non-Plan expenditure and 10.8 per cent growth in Plan expenditure. Consequently, a slippage is likely in the revenue and fiscal deficits budgeted this year notwithstanding the efforts taken to minimize it.

1.66 The fiscal outcome of states (combined) in 2008-9 and 2009-10 was much better with fiscal deficit lower than 3.0 per cent of GDP and moderate levels of revenue surplus and revenue deficit. This was made possible by a year-on-year growth of 10.3 per cent and 9.3 per cent in tax revenue in 2008-9 and 2009-10 respectively. This was composed of 12.3 per cent and 12.8 per cent growth in states' own taxes and 5.5 per cent and 2.9 per cent growth in taxes devolved from the centre in 2008-9 and 2009-10 respectively. With higher levels of grants accruing to them as per the Thirteenth Finance Commission's recommendations, the revenue receipts of states (combined) were placed at 12.3 per cent of GDP in 2008-9. After remaining subdued even in the crisis-affected years of 2008-9 and 2009-10, growth in total expenditure has shot up to 22.1 per cent in 2010-11. As a proportion of GDP, total expenditure of the states was at 16.1 per cent. Even after this level of total expenditure, revenue and fiscal deficits were respectively placed at 0.3 per cent and 2.7 per cent of GDP in 2010-11. In BE 2011-12, fiscal deficit of states is estimated to come down to 2.2 per cent of GDP with revenue surplus at 0.2 per cent of GDP.

1.67 In Mid-Year Analysis 2011, it was indicated that the macroeconomic dimensions of fiscal policies are best understood with reference to fiscal aggregates at the level of consolidated general government. The actual outcome in terms of the deficits of consolidated general government has been much better than what is typically assessed during the course of the year. Fiscal deficit was less than 6 per cent of GDP in 2006-7 and 2007-8. It had increased in the crisis-affected years of 2008-9 and 2009-10 but declined to 7.9 per cent of GDP in 2010-11 and was budgeted at 6.9 per cent of GDP in 2011-12. While the likely slippage in the centre's fiscal outcome this year may push up the consolidated general government deficit, it may be moderated if states continue to perform well. This is essentially an exceptional year when a whole host of factors have turned out differently than was envisaged at the time of presentation of the Budget. A large fiscal correction, followed by a likely slippage (in the previous and current fiscal respectively) is

somewhat in the nature of a cyclical fiscal adjustment; but going forward fiscal consolidation is likely to be anchored in a medium-term framework that mitigates such risks.

HUMAN DEVELOPMENT

1.68 India is passing through a phase of unprecedented demographic changes. This 'demographic dividend' provides India greater opportunities but also poses a challenge. India still has a great distance to go in terms of human development indicators, especially those pertaining to health and education. However, without taking away the importance of doing better, it may be noted that an analysis of the trends during 1980-2011 shows that although lower in HDI ranking, India has performed better than most countries in terms of average annual HDI growth rate.

Trends in India's social-sector expenditures

1.69 Central government expenditure on social services and rural development (Plan and non-Plan) has consistently gone up over the years. It increased from 13.38 per cent of total central government expenditure in 2006-7 to 18.47 per cent in 2011-12. Central support for social programmes has continued to expand in various forms although most social-sector subjects fall within the purview of the states. Expenditure on social services as a proportion of total expenditure increased from 21.6 per cent in 2006-7 to 24.1 per cent in 2009-10 and further to 25 per cent in 2011-12 (BE). As a proportion of the GDP, this share increased from 5.57 per cent in 2006-7 to 7.34 per cent in 2010-11, helping India face the global crisis without much adverse impact on the social sector. In 2011-12 it is expected to be 6.74 per cent as per the BE. While expenditure on education as a proportion of GDP increased from 2.72 per cent in 2006-7 to 3.11 per cent in 2011-12 (BE), the expenditure on health increased from 1.25 per cent in 2006-7 to 1.30 per cent in 2011-12 (BE). These programmes also help in the betterment of health and education of the population, besides contributing to more inclusive development.

Employment

1.70 The Eleventh Five Year Plan (2007-12) aimed at generation of 58 million work opportunities. The NSSO quinquennial survey has reported an increase in work opportunities to the tune of 18 million under the current daily status (CDS) between 2004-5 and

2009-10. However, the overall labour force expanded by only 11.7 million. This was considerably lower than in comparable periods earlier and can be attributed to the much larger retention of youth in education and also because of lower labour force participation among working-age women. In all likelihood this is an indication of improving economic conditions. As a result, unemployment in absolute terms declined by 6.3 million. The lower growth in the labour force is not expected to continue, as educated youth are expected to join it in increasing numbers during the Twelfth Plan and in the years beyond. This means that the pace of job/livelihood creation has to be greatly accelerated. The Twelfth Plan Approach Paper therefore lays greater stress on skill building which can be viewed as an instrument for improving the effectiveness and contribution of labour to overall production.

1.71 A comparison between different estimates of unemployment in 2009-10 indicates that the CDS estimate of unemployment is the highest (Table 1.8). The higher unemployment rates according to the CDS approach compared to the weekly status and usual status approaches indicate a high degree of intermittent unemployment. Interestingly, urban unemployment was higher under both the usual principal and subsidiary status (UPSS) and current weekly status (CWS) but rural unemployment was higher under the CDS approach. However, overall unemployment rates were lower under each of the measures of unemployment vis-à-vis 2004-5.

1.72 The Employment Situation in 2010-11 as per Quarterly Survey Reports (July to September 2011) indicates that the upward trend in employment generation since July 2009 has been maintained. The results for selected sectors, i.e. textiles including apparel, leather, metals, automobiles, gems and jewellery, transport, information technology (IT) / business process outsourcing (BPO) and handloom/

Table 1.8 : All-India NSS 66th Round Rural and Urban Unemployment Rates

Sl. No.	Estimate	Rural 2009-10	Urban 2009-10	Total 2009-10	Total 2004-05
1	UPSS	1.6	3.4	2.0	2.3
2	CWS	3.3	4.2	3.6	4.4
3	CDS	6.8	5.8	6.6	8.2

Source : NSSO

powerloom show that overall employment in September 2011 over September, 2010 increased by 9.11 lakh, with the highest increase recorded in the IT/BPO sector (7.96 lakh) followed by metals (1.07 lakh), automobiles (0.71 lakh), gems and jewellery (0.08 lakh), and leather industries (0.07 lakh).

Unique Identification Authority of India (UIDAI)

1.73 Implementation of the Unique Identification (UID) project has progressed and about 13 crore Aadhaar numbers (UID numbers) have already been generated. The Aadhaar number has been recognized as valid proof of identification /proof of address for obtaining new LPG connections. This will considerably simplify the process of disbursement of welfare funds by government departments.

SUSTAINABLE DEVELOPMENT AND CLIMATE CHANGE

1.74 Sustainable development is a difficult balancing act in countries especially with low incomes. Society has to simultaneously accomplish three things with trade-offs: improve economic well-being with social justice for the present generation, yet manage with more restrained use of land, air, forest, energy and water resources, and protect the interests of future generations. The choices are more difficult in developing countries—because they affect people's livelihoods. For such a 'stewardship' to succeed, therefore, it has to respond to people's needs, share information on choices and costs, and ensure participation and ownership. This, it is hoped, will be kept at centre stage of the Second Earth Summit in Rio in June 2012 that is likely to take stock of sustainable development priorities globally.

1.75 India has done well on all these counts of stewardship over the past decades. It has followed a conscious path in response to the key environmental issues. Sustainable development in terms of environmental concerns has been a recurring theme in Indian policy and planning. Economic reforms since the 1980s have accelerated growth and incomes. Social well-being has improved broadly, as measured by gains in life-expectancy and other indicators. India has stepped up protection of its natural environment such as its forests. India's particular development path has relied on fast-growing services, which has helped reduce the emissions intensity of its growth path and accelerate

literacy and education. While India could have done even better, much has been accomplished. The reasons behind such progress are undoubtedly strong institutional underpinnings: democratic participation, Constitutional protection of social justice, steady accretion of environmental laws and regulations, multiple actors, markets, and expanding government programmes and policies.

1.76 The challenges ahead are, nevertheless, large. The 2009 State of the Environment Report by the Ministry of Environment and Forests (MOEF) clubs the issues under five key challenges faced by India, which are climate change, food security, water security, energy security, and managing urbanization. Broad-based economic and social development is ultimately the answer for greater environmental sustainability. Economic pricing of energy and other resources will be key to switching to a more sustainable development path. Deployment of appropriate technologies is certainly going to be crucial. At the same time, stepped-up public spending on energy access and other basic necessities for the poor will be required.

1.77 The challenge of climate change has been receiving intense political attention both at domestic and international levels. Climate change is primarily caused by the building up of greenhouse gases (GHGs) in the atmosphere. With climate change, the type, frequency, and intensity of extreme events, floods, and droughts are expected to increase. Thus climate change represents additional stress on ecological and socio-economic systems that are already facing tremendous pressure due to haphazard economic development. Hence, addressing climate change is a major challenge in terms of policies and resources needed to address it at domestic and international levels.

1.78 Internationally the United Nations Framework Convention on Climate Change (UNFCCC, the Convention) was set up in 1992 and entered into force in 1994. Although global in scope, it differentiated the commitments/responsibilities of parties on the basis of respective capabilities, economic structures, and resource base and on the basis of the principle of 'equity' which is at the core of the climate change debate. The Convention lays down binding commitments for the developed countries, taking into account their historical responsibilities. It recognizes that economic and social development and poverty eradication are the 'first and overriding priorities' of developing countries.

1.79 Climate change is a complex policy issue with major implications in terms of finance. All actions to address climate change ultimately involve costs. Funding is vital for countries like India to design and implement adaptation and mitigation plans and projects. Lack of funding is a large impediment to implementing adaptation plans. The scale and magnitude of the financial support required by developing countries to enhance their domestic mitigation and adaptation actions are a matter of intense debate in the multilateral negotiations under the UNFCCC. The Convention squarely puts the responsibility for provision of financial support on the developed countries, taking into account their contribution to the stock of GHGs in the atmosphere. Given the magnitude of the task and the funds required, domestic finances are likely to fall short of the current and projected needs of the developing countries. Global funding through the multilateral mechanism of the Convention will enhance domestic capacity to finance the mitigation efforts.

1.80 The recently held Durban Climate Change Conference from 28 November to 10 December 2011 marks an important step forward in the climate change negotiations (see Box 12.6 of Chapter 12 for details). The Durban outcomes made significant contribution as they established the second commitment period of the Kyoto Protocol and operationalized some of the key Cancun agreements related to a Green Climate Fund (GCF), Technology Mechanism (TM), and Adaptation Framework. The Durban outcomes also opened a window for discussions on the post 2020 arrangements for the global climate change regime for which the Durban Platform has been launched. Though India and other developing countries came under tremendous pressure at Durban, India took the lead in ensuring that the new arrangements are firmly anchored in the Convention and are based on the principles of 'common but differentiated responsibilities and equity'.

PROSPECTS, SHORT TERM AND MEDIUM TERM

1.81 The financial crisis in Europe, along with certain exogenous shocks like the Japanese nuclear disaster, has resulted in a sharp global economic slowdown during 2011-12. When this happens so quickly after a recession—the last one being in 2008-9—it is not easy to deal with. Most of the

standard and well-known policies are already used to near capacity and a second dose can backfire. The entire world, especially Europe, is treading with caution and working on devising novel cures for the problems on hand. Thanks to India's rapid growth over the last two decades and growing integration with the world, it can no longer be impervious to global developments. Not surprisingly, the Indian economy has also been adversely affected and its GDP growth is likely to decline to 6.9 per cent during the current year, somewhat mirroring what happened in 2008-9, when growth was 6.7 per cent; and the pressure is on for the nation to improvise policies to revive growth.

1.82 There is no doubt that a part of India's slowdown is rooted in domestic causes. The persistent inflation that remained over 9 per cent for much of the year and needed to be tamed played a role. There were also the pressures of democratic politics, which slowed reforms. Keeping these factors in view, it seems reasonable to endorse the CSO's AE of 6.9 per cent growth for this year. Calculations based on tracking several statistical indicators and projections of incremental capital-output ratios lead to a forecast of the growth rate of real GDP for 2012-13 to be 7.6 (+/-0.25) per cent.

1.83 The main reason for the recovery to be initially slow is the slight decline in investment rate. In the third quarter of 2011-12, gross fixed capital formation as a ratio of GDP was 30 per cent, down from 32.3 per cent one year ago. But as fiscal consolidation gets back on track, savings and capital formation should begin to rise. Moreover, with the easing of inflationary pressures in the months to come, there could be a reduction in policy rates by the RBI, which would encourage investment activity that could have a positive impact on growth. These factors, along with the fact that India's investment rate at 35.1 per cent, is still an impressive figure, should result in growth consolidating in 2012-13 and picking up rapidly thereafter. Preliminary calculations suggest that the growth rate of GDP in 2013-14 will be 8.6 per cent. Long-term forecasts of course always come with a larger margin of error. These projections are based on assumptions regarding factors like normal monsoons, reasonably stable international prices, particularly oil prices, and global growth somewhere between where it now stands and 0.5 per cent higher. A deviation from these situations would have an impact on the growth trajectory of India. However, thanks to 15 years of robust growth

and nearly a decade of over 30 per cent investment rate, the economy now has enough resilience for an optimistic view that India can be the leading engine of global growth.

1.84 Agricultural growth in the Eleventh Five Year Plan has been less than the target of 4 per cent despite a clear improvement compared to the previous plan periods. Though agriculture has now shrunk as a proportion of GDP to 13.9 per cent, as is only to be expected of a growing economy, it is vital sector and provider of livelihood for more than 50 per cent of the population. How this sector performs also has large implications for overall prices and, hence, it is a sector deserving of special attention. The area under foodgrains production has declined over the last three decades. That in itself is not worrying but what is of concern is the low productivity of Indian agriculture. In yield parameters, India is lagging behind global levels in most crops. Concerted and focused efforts are required for addressing the challenge of stagnating productivity levels in agriculture. A holistic approach, simultaneously working on agricultural research and development, dissemination of technology, and provision of agricultural inputs such as quality seed, fertilizers, pesticides, and irrigation, would be important. Above all, the need is to raise investment in agriculture. Specifically there is a need to promote horticulture, fisheries, livestock farming, poultry and related activities by raising both public and private investment in these sectors. Furthermore, higher investment will be required in watersheds development, contour-bunding and water harvesting structures. Some of these activities could be taken up under MNREGA.

1.85 It is also important to understand that productivity itself will get a fillip if the supply chain from farm to consumer can be improved. This will lead to farmers getting a higher price for their products and will incentivize them to invest and produce more. The crux of an improved supply chain is not for government to try to provide this directly by the public service delivery authorities but to take policy steps that facilitate private players to provide this vital service. A lot of these facilitating policies simply consist of altering rules to allow individuals and firms to enter into this business and cleaning up the regulations so that people do not unnecessarily have to seek permission at every juncture of business and trade. This theme recurs later in the Survey.

1.86 The industrial sector performed poorly this year and the share of industry in the GDP, which had peaked at 28.7 per cent, has now retreated to 27 per cent. This is an adverse move for an emerging economy. It is expected that this decline will gradually get reversed on its own, starting in 2012-13. However, industry is such an important driver of an emerging economy's growth and provider of jobs that special effort needs to be made to get this sector growing much more rapidly than it has done this year. One simple clue lies in the fact that Indian services, such as information technology (IT) and financial services, have done very well over the last two decades and the services sector, having been largely outside of the tax net, did not have to interact much with the state machinery and was also less affected by infrastructural handicaps since a lot of services do not need freights and ports. This suggests that the manufacturing and industry can be helped by improving the infrastructure and lessen the need for interfacing with administration. This is a sector strong enough to take off on its own; what is simply needed is to provide an enabling business environment. In this regard, the National Manufacturing Policy, as a first dedicated policy measure for manufacturing is expected to provide a major impetus to the manufacturing sector of the Indian economy. The National Manufacturing Policy, while adequately addressing the concerns relating to labour welfare and environmental conservation, attempts to simplify business regulations and certification to reduce transactions costs for industry and improve its competitive position.

1.87 In 2010-11 and 2011-12, there is a slight moderation in services growth. This is mainly due to the steep fall in growth of public administration and defence services, creating some fiscal space for the government. Growth in trade, hotels, and restaurants is more robust at 11.2 per cent. If interest rates remain elevated, there would be some concern about growth in real estate, ownership of dwellings, and business services which has started decelerating. The outlook for some of the services in the economy is also linked to the global prospects. While software services exports have continued to be steady, the unfolding events in the euro area could lead to some sluggishness in this sector. The growth in fair-weather business services which has already shown signs of deceleration may not get better. Among the other two major services, transportation has already been affected with the Baltic dry index at an all-time

low, though this may be of a passing nature. While travel and tourism could also be affected, it could also lead to a shift in tourist inflow pattern with increased inflow of holiday backpackers searching for cheaper destinations like India. The rise in tourists from South Asia, East Asia, and South East Asia could further help this sector.

1.88 Monetary policy remained focused on controlling inflation and anchoring inflationary expectations, with 13 adjustments in policy rates since March 2010. This had a short-term slowing effect on growth, as was anticipated. But it also contributed to moderating inflation to around 6.5 per cent by March. Vigilance will nevertheless be required and steps need to be taken to quickly deal with any unexpected developments and global shocks such as increases in the price of crude oil.

1.89 The recent regulatory prescriptions for European banks have brought in fears of deleveraging. Indian banks are not expected to have any direct

impact on account of their negligible exposure to the troubled zone. However, there could be indirect impact on account of funding pressures. The scope for countercyclical financial policy could be explored in financial regulations in order to minimize the negative impact of accumulated financial risks. This will go a long way in providing needed stability to the financial system.

1.90 As indicated earlier, slippage is likely in the fiscal outcome this year in respect of the centre; however, the states combined are likely to be on track. The less-than-budgeted fiscal outcome owes to fiscal risks mainly emanating from assumptions regarding international crude prices and below target revenue generation. Going forward, fiscal consolidation would need to be anchored in a framework that addresses some of the risks like rise in crude prices and the chapter that follows details the options in this regard, which are essentially micro-foundational reforms for achieving desired macroeconomic outcomes.
