APPENDIX

Estimates of sampling errors ...................................................................................... 155
INTRODUCTION

The 2015-16 National Family Health Survey (NFHS-4), the fourth in the NFHS series, provides information on population, health, and nutrition for India and each state and union territory. For the first time, NFHS-4 provides district-level estimates for many important indicators. All four NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-4 was provided by the United States Agency for International Development (USAID), the United Kingdom Department for International Development (DFID), the Bill and Melinda Gates Foundation (BMGF), UNICEF, UNFPA, the MacArthur Foundation, and the Government of India. Technical assistance for NFHS-4 was provided by ICF, Maryland, USA. Assistance for the HIV component of the survey was provided by the National AIDS Control Organization (NACO) and the National AIDS Research Institute (NARI), Pune.

Four survey questionnaires—household, woman’s, man’s, and biomarker—were used to collect information in 19 languages using Computer Assisted Personal Interviewing (CAPI). All women age 15-49 and men age 15-54 in the selected sample households were eligible for interviewing. In the household questionnaire, basic information was collected on all usual members of the household and visitors who stayed in the household the previous night, as well as socioeconomic characteristics of the household, water and sanitation, health insurance, and number of deaths in the household in the three years preceding the survey. Two versions of the woman’s questionnaire were used in NFHS-4. The first version (district module), which collected information on women’s characteristics, marriage, fertility, contraception, reproductive health, children’s immunizations, and treatment of childhood illnesses, was fielded in the entire sample of NFHS-4 households. Information on these topics is available at the district, state, and national levels. In the second version of the questionnaire (state module), four additional topics, namely, sexual behaviour, HIV/AIDS, husband’s background and women’s work, and domestic violence, were also included. This version was fielded in a subsample of NFHS-4 households designed to provide information only at the state and national levels. The man’s questionnaire covered the man’s characteristics, marriage, number of children, contraception, fertility preferences, nutrition, sexual behaviour, attitudes towards gender roles, HIV/AIDS, and lifestyle. The biomarker questionnaire covered measurements of height, weight, and haemoglobin levels for children; height, weight, haemoglobin, blood pressure, and random blood glucose for women age 15-49 years and men age 15-54 years, and the collection of finger-stick blood for HIV testing in a laboratory. Questionnaire information and biomarkers were collected only with informed consent from the respondents.

The NFHS-4 sample was designed to provide estimates of all key indicators at the national and state levels, as well as estimates for most key indicators at the district level (for all 640 districts in India, as of the 2011 Census). The total sample size of approximately 572,000 households for India was based on the size needed to produce reliable indicator estimates for each district and for urban and rural areas in districts in which the urban population accounted for 30-70 percent of the total district population. The rural sample was selected
through a two-stage sample design with villages as the Primary Sampling Units (PSUs) at the first stage (selected with probability proportional to size), followed by a random selection of 22 households in each PSU at the second stage. In urban areas, there was also a two-stage sample design with Census Enumeration Blocks (CEB) selected at the first stage and a random selection of 22 households in each CEB at the second stage. At the second stage in both urban and rural areas, households were selected after conducting a complete mapping and household listing operation in the selected first-stage units.

The figures of NFHS-4 and earlier rounds may not be strictly comparable due to differences in sample size, and NFHS-4 will be a benchmark for future surveys. NFHS-4 fieldwork for Kerala was conducted in all 14 districts of the state from 8 March to 3 October 2016 by the Society for Promotion of Youth & Masses (SPYM) and collected information from 11,555 households, 11,033 women age 15-49 (including 2,397 women interviewed in PSUs in the state module), and 2,086 men age 15-54. Survey response rates were almost 100 for households, 98 percent for women, and 95 percent for men.

This report presents the key findings of the NFHS-4 survey in Kerala, followed by detailed tables and an appendix on sampling errors. At the time of finalization of this report, wealth quintiles for the country as a whole were not ready. Therefore, on finalization of the national report, the breakup of key indicators by wealth quintiles for all states will be provided as an additional document and uploaded on the official website of MoHFW and IIPS.
HOUSEHOLD CHARACTERISTICS

Household composition
Less than half of Kerala’s households (47%) are in urban areas. On average, households in Kerala are comprised of 4 members. Twenty percent of households are headed by women, with 19 percent of the population living in female-headed households.

The majority (59%) of households in Kerala have household heads who are Hindu (59%). Twenty-three percent of households have household heads who are Muslim and 18 percent of households have Christian household heads.

About half (49%) of households in Kerala have household heads who belong to an other backward class, 10 percent belong to a schedule caste, and a very small proportion (1%) belong to a scheduled tribe. Almost two-fifths (38%) of household heads do not belong to scheduled castes, scheduled tribes, or other backward classes.

Twenty percent of Kerala’s population is under age 15; 10 percent is age 65 and over. The overall sex ratio of the population is 1,049 females per 1,000 males, and the sex ratio of the population under seven years of age is slightly lower (1,020 females per 1,000 males). Ninety-two percent of persons have an Aadhaar card.

Among children below 18 years of age, 2 percent have experienced the death of one or both parents. In all, 79 percent of children below 18 years of age live with both parents, 19 percent live with one parent (mostly with their mother), and the remaining 2 percent live with neither parent. Births of almost all (98%) children under five years of age were registered with the civil authorities, and 87 percent of children have a birth certificate.

Housing characteristics
Almost 9 in 10 households in Kerala (89%) live in a pucca house and almost all households (99%) have electricity. Less than 1 percent of households do not use a sanitation facility, which means that household members practice open defecation, an improvement from 4 percent at the time of NFHS-3. Ninety-eight percent of households use an improved sanitation facility.

Almost all (98%) households in Kerala use an improved sanitation facility.

Ninety-four percent of households use an improved source of drinking water, but only 20 percent have water piped into their dwelling, yard, or plot. Urban households (23%) are more likely than rural households (18%) to have water piped into their dwelling, yard, or plot. Most households use a protected dug well, a protected spring, rainwater, or a community reverse osmosis (RO) plant as their source of drinking water (62%). Ninety-two percent of households treat their drinking water to make it potable (mostly by boiling). Fifty-seven percent of households use a clean fuel for cooking (mostly LPG or natural gas).
Selected household possessions
Almost all (98%) urban and rural households in Kerala have a mobile phone. Ninety-five percent of households have a bank or post office account. BPL cards are held by 30 percent of households, compared with 32 percent in NFHS-3. Twenty percent of rural households and 10 percent of urban households own agricultural land. Overall, 16 percent of all households in Kerala own agricultural land.

EDUCATION

School attendance among children
Ninety-seven percent of children age 6-17 years in Kerala attend school (98% in urban areas and 97% in rural areas). School attendance is universal at age 6-14 years, and then drops to 94 percent at age 15-17 years. There is almost no gender disparity in school attendance in the 6-14 year age group.

Literacy, educational attainment, and media exposure
In NFHS-4, literate persons are those who have either completed at least standard six or passed a simple literacy test conducted as part of the survey. According to this measure, 98 percent of women age 15-49 and 99 percent of men age 15-49 are literate.

Almost half of women age 15-49 (48%) in Kerala have completed 12 or more years of schooling, compared with 45 percent of men.

Only 1 percent of women and men age 15-49 have never been to school. Forty-eight percent of women age 15-49 have completed 12 or more years of schooling, compared with 45 percent of men.

Media exposure is high among women and men in Kerala. More than 9 in 10 women and men watch television at least once a week. Men (89%) are much more likely than women (77%) to read a newspaper or magazine at least once a week. Only 1 percent of men and 3 percent of women are not regularly exposed to print media or other forms of media.
**Fertility**

**Age at first marriage**
The median age at first marriage is 21.5 years among women age 25-49 years. Eight percent of women age 20-24 years got married before the legal minimum age of 18, down from 15 percent in NFHS-3. Three percent of men age 25-29 years got married before the legal minimum age of 21, the same as in NFHS-3.

**Fertility levels**
The total fertility rate (TFR) in Kerala is 1.6 children per woman in both urban and rural areas, well below replacement level fertility. Fertility remained almost unchanged in the 13 years between NFHS-1 and NFHS-3 (1.9-2.0), but it declined by 0.4 children in the 10 years between NFHS-3 and NFHS-4.

Among births in the three years preceding the survey, 13 percent were of birth order three or higher, compared with 18 percent in NFHS-3.

The total fertility rate is below 2.0 children in every group except scheduled tribes (2.3) and women with less than 5 years of schooling (2.1).

**Pregnancy outcome**
Ninety percent of last pregnancies in the five years preceding the survey ended in a live birth, and the remaining 10 percent terminated in foetal wastage (abortion, miscarriage, or stillbirth). Abortion and miscarriage are the most commonly reported types of foetal wastage, accounting for 5 percent each of all pregnancies. More than three-fourths (78%) of the abortions were performed in the private health sector (78%) and 21 percent were performed in the public health sector. One-sixth of women reporting an abortion reported having complications from the abortion.
health sector. One-sixth of women reporting an abortion reported having complications from the abortion.

**Teenage pregnancy**
Among young women age 15-19 in Kerala, 3 percent have already begun childbearing, that is, they have already had a live birth or are pregnant with their first child, down from 6 percent in NFHS-3. Two percent of women age 18 years have started childbearing, but this proportion increases sharply to 12 percent among women who are 19 years old. Muslim women age 15-19 are more likely to have begun childbearing than Hindu and Christian women. Women age 15-19 belonging to scheduled tribes are more likely to have begun childbearing women from than any other caste/tribe group.

**Birth intervals**
The median interval between births in the five years before the survey in Kerala is 49.5 months, eight months longer than in NFHS-3. Four percent of births take place within 18 months of the previous birth and 11 percent occur within 24 months. Twenty-six percent of births occur within three years of the previous birth. Research shows that waiting at least three years between children reduces the risk of infant mortality.

---

**Twenty-six percent of births in Kerala occur within three years of the previous birth.**

---

**Fertility preferences**
Sixty-three percent of currently married women and 66 percent of currently married men want no more children, are already sterilized, or have a spouse who is sterilized. Among those who want another child, 39 percent of women and 37 percent of men would like to wait at least two years before the next birth. Seventy-five percent of women and 80 percent of men consider the ideal family size to be two or fewer children.

In Kerala there is some preference for sons. Eleven percent of women and 15 percent of men want more sons than daughters, but only 5-7 percent of women and men want more daughters than sons. However, most men and women would like to have at least one son and at least one daughter.

Women’s desire for more children is slightly affected by their current number of sons. For example, among women with two children, 85 percent with two sons and 84 percent with one son want no more children, compared with 80 percent with two daughters who want no more children. Notably, however, the proportion of currently married women with two children who want no more children irrespective of their number of sons decreased from 88 percent to 83 percent in the 10 years between NFHS-3 and NFHS-4.
In Kerala, unplanned pregnancies are not common. There is almost no difference between the total wanted fertility rate (1.5 children per woman) and the total fertility rate (1.6 children per woman).

**FAMILY PLANNING**

**Contraceptive knowledge and use**

Knowledge of contraception is almost universal in Kerala. However, some methods are still less well known. Only about half (49%) of currently married women know about injectables, and 43 percent know about female condoms. Among all women, 44 percent know about emergency contraception.

The contraceptive prevalence rate (CPR) among currently married women age 15-49 is 53 percent, considerably lower than in NFHS-3 (69%). Modern method use, at 50 percent, is also lower than its level in NFHS-3 (58%). Notably, the share of female sterilization in contraceptive method use increased from 71 percent in NFHS-3 to 86 percent in NFHS-4. Contraceptive use in NFHS-4 increases sharply with age, from 19 percent for women age 15-19 to 68 percent for women age 40-49.
In Kerala, contraceptive use does not vary between rural areas and urban areas (53% each). Contraceptive prevalence varies substantially by schooling, decreasing from 73 percent among women with no schooling to 44 percent among women with 12 or more years of schooling (44%). Seventy-three percent of currently married women with no schooling use female sterilization, compared with 34 percent of currently married women with 12 or more years of schooling. Muslim women (43%) are much less likely to use contraception than Hindu women (58%) or Christian women (55%).

Women in Kerala are slightly more likely to use contraception if they already have a son. For example, among women with two children, 71 percent with at least one son use a method of family planning, compared with 67 percent of women with two daughters and no sons.

The most common modern spacing methods used by currently married women in Kerala are condoms/\textit{Nirodhs} (3%) and IUDs or PPIUDs (2%).

Sixty percent of sterilized women had their sterilization operation in the public sector, mainly in a government or municipal hospital, and 58 percent of condom/\textit{Nirodhs} users get their supply from the private sector. Seventy-one percent of IUD or PPIUD users had their IUD insertion in the public sector.

The 12-month discontinuation rate for all contraceptive methods is 43 percent. Sixty-three percent of users of modern spacing methods discontinued use within the first year after they adopted the method. The most common reason for discontinuation is ‘other’ fertility related reasons (infrequent sex or husband away, difficulty of getting pregnant or menopausal, and marital dissolution or separation).

Only 55 percent of users of selected modern contraceptive methods were told by a health or family planning worker about other methods they could use.

**Informed choice**

Women who know about all available contraceptive methods and their side effects can make better choices about what method to use. Only 56 percent of users of selected modern contraceptive methods were ever told about possible side effects or problems with their method, only 48 percent were told what to do if they experienced any side effects, and only 55 percent were told by a health or family planning worker about other methods they could use.
**Men’s attitudes**
Fifteen percent of men age 15-49 in Kerala agree that contraception is women’s business and a man should not have to worry about it. Only 16 percent of men think that women using contraception may become promiscuous. Seven in 10 men know that a condom, if used correctly, protects against pregnancy most of the time.

**Unmet need**
Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely, but are not using contraception. According to this definition, 14 percent of currently married women have an unmet need for family planning, up from 10 percent in NFHS-3. Currently, 80 percent of the demand for family planning is being satisfied and 75 percent of the demand is being satisfied by modern methods. The percentage of demand for family planning that is satisfied has decreased from 89 percent to 80 percent in the 10-year period since NFHS-3.

**INFANT AND CHILD MORTALITY**
The infant mortality rate in Kerala in NFHS-4 is estimated at 6 deaths before the age of one year per 1,000 live births, by far the lowest rate in any state in India. The infant mortality rate has decreased from the NFHS-3 estimate of 15, the NFHS-2 estimate of 16, and the NFHS-1 estimate of 24. The under-five mortality rate for Kerala is 7 deaths per 1,000 live births (also the lowest rate in India), down substantially from the NFHS-3 estimate of 16, the NFHS-2 estimate of 19, and the NFHS-1 estimate of 32.
Girls have a slightly higher mortality rate than boys during the neonatal period (in the first month of life). Boys have slightly higher mortality rates than girls from age 1 month to 5 years. Infant and under-five mortality rates are less than 10 per 1,000 for almost every group.

**MATERNAL HEALTH**

**Antenatal care**

Almost all mothers who gave birth in the five years preceding the survey received antenatal care (ANC) for their last birth from a health professional (99% from a doctor and less than 1% from an auxiliary nurse midwife (ANM), lady health visitor (LHV), nurse, or midwife). Less than 1 percent did not receive any antenatal care. Among mothers who gave birth in the five years preceding the survey, 90 percent registered the pregnancy for the most recent live birth. Among the registered pregnancies, 84 percent received a Mother and Child Protection Card (MCP Card).

**How does appropriate antenatal care vary with schooling?**

*Percentage of last births in the past five years*

Note: Categories “No schooling” and “Less than 5 years of schooling” not shown since there are fewer than 25 unweighted cases.
Ninety-five percent of women received antenatal care during the first trimester of pregnancy, as is recommended. Ninety percent of mothers had four or more antenatal care visits. For 96 percent of their last births, mothers received iron and folic acid (IFA) supplements, but only 67 percent consumed them for the recommended 100 days or more. Ninety-seven percent of last births were protected against neonatal tetanus through tetanus toxoid vaccinations given to the mother. Twenty-one percent of mothers took an intestinal parasite drug during pregnancy.

Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, at least two-thirds received advice on each of five different areas (83% received advice on breastfeeding, 80% on keeping the baby warm, 73% on the importance of institutional delivery, 72% on family planning, and 68% on cord care).

Even when women receive antenatal care, sometimes they do not receive all the services needed to monitor their pregnancy. In Kerala, however, 99 percent of women who received antenatal care for their last birth received each of the services needed to monitor their pregnancy: having their weight taken, having their abdomen examined and blood pressure measured, having a urine sample taken, and having a blood sample taken.

An ultrasound test was performed during 96 percent of pregnancies in the five years preceding the survey. Because ultrasound testing is nearly universal, there is little variation in the prevalence of ultrasound testing by background characteristics.
**Delivery care**
Almost all births in Kerala take place in a health facility, mostly a private health facility (62%). Health facility births were also almost universal at the time of NFHS-3, as well. The universality of institutional births cuts across all the background characteristics.

Almost all births during the past five years took place in a health facility with assistance from a skilled provider. More than one-third of births (36%) were delivered by caesarean section, and 36 percent of caesarean sections (13% of all births) were emergency caesarean sections.

Among women who had a live birth in the five years preceding the survey that was delivered in a health facility, 20 percent received financial assistance under the Janani Suraksha Yojana (JSY) for their most recent birth. Scheduled caste women were much more likely than any other caste/tribe group of women to receive financial assistance under JSY, and Hindu women were more likely than Muslim or Christian women to receive financial assistance under JSY.

**Almost all children in Kerala who were born in the past five years were born in a health facility and took place with assistance from a skilled provider.**

**Postnatal care**
Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. In Kerala, 93 percent of mothers had a postnatal check after their last birth and 89 percent had a postnatal check within two days of the birth, as is recommended.

Forty-nine percent of last births in the five years preceding the survey received a health check in the first two days after birth and 49 percent of newborns either did not have any health check or had it after a week.

**Male involvement in maternal care**
Ninety-seven percent of men with a child under three years of age said that the youngest child’s mother received antenatal care. Eighty-nine percent of men with a child under three years said they were present during at least one antenatal check received by the child’s mother (92% in urban areas and 86% in rural areas), but only 57 percent were told by a health provider or health worker what to do if the mother had a pregnancy complication. Thirty-nine of men were told about vaginal bleeding or convulsions as signs of pregnancy complications, and 52-61 percent were told about other signs of pregnancy complications (high blood pressure, prolonged labour, and severe abdominal pain).
Among fathers with a child less than three years of age, 61-85 percent were given information about various aspects of maternal care. Eighty-five percent were told about the importance of proper nutrition for the mother during pregnancy and 81 percent were told about the importance of delivering the baby in a health facility. Sixty-one percent were told about family planning or delaying the next child by a health provider or a health worker.

**CHILD HEALTH**

**Vaccination of children**

Eighty-two percent of children age 12-23 months received all basic vaccinations against six major childhood illnesses (tuberculosis, diphtheria, pertussis, tetanus, polio, and measles) at any time before the survey. However, almost all children are at least partially vaccinated; only 2 percent have not received any vaccinations at all.

Ninety-eight percent of children have received a BCG vaccination, and 89-90 percent of children received other basic vaccinations.

</table>

Between NFHS-3 and NFHS-4, there was an increase in vaccination coverage for three doses of DPT (from 84% to 90%), measles (from 82% to 89%), BCG (from 96% to 98%), and three doses of polio vaccine (from 83% to 89%). Overall, there was an increase in the coverage of all basic vaccinations (from 75% to 82%). In addition, at the time of NFHS-4, 82 percent of children had received all three recommended doses of hepatitis B vaccine.

Muslim children (75%) were less likely to receive all basic vaccinations than Christian children (88%) or Hindu children (86%), but there is not much difference in vaccination coverage by other background characteristics.
More than 4 in 5 children age 12-23 months have received all basic vaccinations.

Childhood illnesses
In the two weeks before the survey, 1 percent of children under age five years had symptoms of an acute respiratory infection (cough accompanied by (1) short, rapid breathing that is chest related and/or (2) difficult breathing that is chest related).

Eleven percent of children under age five were reported to have had fever in the two weeks preceding the survey; 90 percent of these children were taken to a health facility or provider for advice or treatment.

Overall, 3 percent of children under age five years had diarrhoea in the two weeks preceding the survey. Seventy-six percent of these children were taken to a health facility or health provider. Ninety-seven percent of mothers of young children have heard of oral rehydration salt (ORS) packets for the treatment of diarrhoea, but only 49 percent of children with diarrhoea were given ORS. Seventy-five percent of children with diarrhoea were given gruel and 87 percent were given some type of oral rehydration therapy (ORT). Fourteen percent were given zinc supplements. Ten percent of children with diarrhoea did not receive any type of treatment at all.

To reduce dehydration and minimise the effects of diarrhoea on nutritional status, it is recommended that normal feeding of children be continued when they have diarrhoea and that the amount of fluids given should be increased. However, in Kerala only 21 percent of children with diarrhoea received more to drink than normal. Only one-third of children received the same amount to drink as usual. Of greater concern, almost half of children (46%) with diarrhoea were given less to drink. Only 34 percent of children with diarrhoea were given the same amount of food or more food, as recommended. Fifty-six percent of children with diarrhoea were given ORT or increased fluids and continued feeding, as is recommended.

Integrated Child Development Services (ICDS)
The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based anganwadi centres.

Forty-nine percent of children under 6 years receive services of some kind from an anganwadi centre. The most common services that age-eligible children receive are supplementary food (46%), growth monitoring (44%), early childhood care or preschool (36%), and health check-ups (35%). The service that is least likely to be accessed is immunizations (19%). Over two-fifths of the mothers of children who were weighed at an anganwadi centre received counselling from an anganwadi worker or an ANM. Among children under 6 years, a little less than one-third of their mothers (32%) received any services from an anganwadi centre during pregnancy, and a little less than one-fourth of their mothers (24%) received any services while breastfeeding.
Infant feeding

Although breastfeeding is nearly universal in Kerala, only 53 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. Ninety-five percent are put to the breast within the first day of life, but only 63 percent started breastfeeding in the first hour of life (as recommended). While the initiation of breastfeeding indicators show some improvement since NFHS-3, many infants are still deprived of the highly nutritious first milk (colostrum) and the antibodies it contains.

It is recommended that nothing be given to children other than breastmilk even in the first three days when the milk has not begun to flow regularly because prelacteal feeds limit the frequency of suckling by the infant and expose the baby to the risk of infection. However, 9 percent of children are given something other than breastmilk during the first three days. Overall, 98 percent of children continue breastfeeding at 1 year and 85 percent continue breastfeeding at 2 years.

After the first 6 months, breastmilk is no longer enough to meet the nutritional needs of infants. Therefore, complementary foods should be added to the diet of the child. However, at age 6-8 months less than two-thirds of children (63%) in Kerala receive breastmilk and complementary foods.

WHO has several recommendations for infant and young child feeding (IYCF) practices for children age 6-23 months. The key IYCF indicators measure the adequacy of dietary diversity and meal frequency for breastfed and nonbreastfed children. A little more than two-fifths of children age 6-23 months (44%) are fed the recommended minimum number of times per day and even fewer (38%) are fed from the appropriate number of food groups. Only 21 percent are fed according to all three recommended practices.
Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Vitamin A is an essential nutrient for the immune system. Severe vitamin A deficiency (VAD) can cause eye damage and a higher risk of dying from measles and diarrhoeal disease. The Government of India recommends that children under 5 years of age receive vitamin A supplements every six months, starting at age 9 months. In Kerala, 76 percent of children age 9-59 months were given a vitamin A supplement in the past six months, but only 61 percent of children age 9-23 months ate vitamin A-rich foods during the day or night before the survey.

Iron deficiency is a primary cause of anaemia. Eating foods rich in iron and taking iron supplements can help prevent anaemia. Only 43 percent children age 9-23 months ate iron-rich foods during the day or night before the survey, and 18 percent of children age 6-59 months were given iron supplements in the week before the survey. In addition, 51 percent of children age 6-59 months were given deworming medication in last 6 months.

**Children’s nutritional status**
In Kerala, 20 percent of children under age five years are stunted, or too short for their age, which indicates that they have been undernourished for some time. Sixteen percent children are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness causing weight loss, and 7 percent are severely wasted. Sixteen percent are underweight, which takes into account both chronic and acute undernutrition, and 3 percent of children are overweight. Even during the first six months of life, when almost all babies are breastfed, 16 percent of children are stunted, 26 percent are wasted, and 21 percent are underweight.

Children’s nutritional status in Kerala has shown improvement since NFHS-3. Stunting decreased by 5 percentage points, from 25 percent to 20 percent, in the 10 years between NFHS-3 and NFHS-4, and the percentage of children who are underweight decreased by 7 percentage points, from 23 percent to 16 percent. The proportion of children who are wasted has remained at the same level (16%).

There are differences in the level of undernutrition by some key background characteristics, but there is not much difference by residence and sex of the child. The level of undernutrition is relatively high among children of underweight mothers, children whose mothers have completed less than 12 years of schooling, and children whose size at birth was reported as small.
**Adults’ nutritional status**

Forty-two percent of women and 37 percent of men age 15-49 are either too thin or overweight or obese. Women and men are more than three times more likely to be overweight or obese than to be thin. Ten percent of women and 9 men are too thin, compared with 32 percent of women and 29 percent of men who are overweight or obese.

Undernutrition is particularly common in the younger age groups, among those who have never been married, and among those from scheduled tribes. In contrast, overweight and obesity are most prevalent in older adults, and those with less schooling.

The use of iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. Nearly all of Kerala’s households (98%) used iodized salt at the time of the survey, an increase of 16 percentage points since NFHS-3.

---

**Anaemia**

Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Iron deficiency is estimated to be responsible for about half of all anaemia globally, but anaemia can also be caused by malaria, hookworm and other helminths, other nutritional deficiencies, chronic infections, and genetic conditions. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious diseases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Anaemia is still a health problem in Kerala, especially among women and children.
More than one-third of children between the ages of 6 and 59 months (36%) are anaemic. This includes 23 percent who are mildly anaemic, 13 percent who are moderately anaemic, and 0.4 percent who suffer from severe anaemia. Anaemia among children is particularly high among younger children, children of birth order 4-5, Muslim children, and scheduled tribe children. Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels among children vary somewhat according to background characteristics, anaemia among children is widespread in every group. Almost one-third (31-32%) of children are anaemic even if their mother has 12 or more years of schooling and even if their mother is not anaemic.

Over one-third (34%) of women are anaemic, which includes 30 percent with mild anaemia, 4 percent with moderate anaemia, and 0.3 percent with severe anaemia. Anaemia is somewhat higher for women in urban areas, women with no formal schooling, and women from scheduled tribes. The level of anaemia is much lower among men (only 12% overall) in every group.

**Adult Health and Health Care**

**Tuberculosis**

In Kerala, 369 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. The prevalence of medically treated tuberculosis is higher among men (552) than among women (192) and is higher in rural areas (401) than in urban areas (332). The prevalence of TB is particularly high among older persons age 60 or more (999 per 100,000) and in households using solid fuel (561) for cooking.

Almost all respondents have heard of tuberculosis (97% of women and 88% of men). Among those who have heard of tuberculosis, 86 percent of women and 78 percent of men know that it is spread through the air by coughing or sneezing. About one-fifth (21%) of women, compared with just 11 percent of men have misconceptions about how tuberculosis is spread. Overall, 83 percent of women and 84 percent of men know that tuberculosis can be cured, and only 16 percent of women and 13 percent of men say that if a family member had tuberculosis, they would want to keep it a secret.
**Diabetes, asthma, goitre, heart disease, and cancer**

According to self-reports, 4,328 per 100,000 women age 15-49 and 4,310 per 100,000 men age 15-49 have diabetes. Overall, 3,141 women and 1,008 men per 100,000 suffer from asthma. The prevalence of goitre or any other thyroid disorder is 8,110 per 100,000 among women and only 473 per 100,000 among men. The prevalence of any heart disease is about the same among women (1,319 per 100,000) and men (1,324 per 100,000). Among the five diseases, cancer is the least common, with 166 women per 100,000, and 56 men per 100,000 reportedly suffering from cancer. The prevalence of all of these diseases among women and men is much higher in older age groups.

**Blood pressure (hypertension)**

Nine percent of women age 15-49 in Kerala have hypertension, including 6 percent with Stage 1 hypertension, 1 percent with Stage 2 hypertension, and 0.5 percent with Stage 3 hypertension. Almost two-thirds (66%) of women have normal blood pressure, including 1 percent of women with normal blood pressure who are taking medicine to lower their blood pressure. The prevalence of hypertension is slightly higher among men than women. Twelve percent of men in Kerala have hypertension, including 8 percent with Stage 1 hypertension and 1 percent each with Stage 2 and Stage 3 hypertension. About half (49%) of men have normal blood pressure, including 1 percent of men with normal blood pressure who are taking medicine to lower their blood pressure. For both women and men, hypertension increases with age and decreases with the level of schooling.

**Blood glucose**

NFHS-4 included measurement of random blood glucose among women age 15-49 and men age 15-54. Four percent of women age 15-49 in Kerala have high blood glucose levels, and an additional 5 percent have very high blood glucose levels. In comparison, 7 percent of men age 15-49 have high blood glucose levels, and an additional 6 have very high blood glucose levels. Older women and men have relatively high blood glucose levels.

**Health examinations**

In Kerala, 61 percent of women have ever undergone an examination of the cervix, 33 percent have ever undergone a breast examination, and 51 percent have ever undergone an examination of the oral cavity. Older women are more likely than younger women to have undergone each of these examinations.

**Tobacco and alcohol use**

Twenty-six percent of men age 15-49, but less than 1 percent of women age 15-49, use any type of tobacco. Men are more likely to smoke cigarettes (21%) than to use other types of tobacco. Among men, the use of any form of tobacco is higher in rural than in urban areas, primarily because men in rural areas are more likely to smoke bidis (7%) than men in urban areas (3%). Most men who smoke cigarettes or bidis smoked 1-5 cigarettes or bidis in the past 24 hours.

In Kerala, only 2 percent of women say that they drink alcohol. Men are more likely to drink alcohol (37%) than to use tobacco (26%). Among men who drink alcohol, 11 percent drink alcohol almost every day, 39 percent say they drink alcohol at least once a week, and 50 percent drink alcohol less than once a week (50%).
Source of health care

In Kerala, the public health sector is the main source of health care for 68 percent of households (72% in rural areas and 63% in urban areas). Within the public health sector, the most households report that their members go to a government hospital (46%), and within the private sector, more husbands (28%) go to a private hospital than other types of facilities.

Health insurance

Despite the emergence of a number of health insurance programmes and health schemes, less than half of households in Kerala (48%) have any kind of health insurance that covers at least one member of the household. Health insurance coverage is somewhat higher in rural areas (50%) than in urban areas (45%). In Kerala, among households with health insurance coverage, one type of health scheme/health insurance dominates: Rashtriya Swasthya Bima Yojana (79% of households), particularly in rural areas (84% of households).

Only 42 percent of women and 33 percent of men age 15-49 years are covered by any health scheme or health insurance. Coverage is higher in rural areas than urban areas, and it increases with age.

HIV/AIDS

Awareness of HIV or AIDS

In Kerala, almost all adult men and women (99%) have heard of HIV or AIDS.

Knowledge of prevention and transmission

Men are much more likely than women to know how HIV/AIDS is transmitted and how to keep from getting it. For example, only 74 percent of men, and 76 percent of women know that having just one uninfected partner who has no other partners can reduce the chance of getting HIV/AIDS, compared with 82 percent of men.

Only 43 percent of women and 51 percent of men in Kerala have a ‘comprehensive knowledge’ about HIV/AIDS. This means they know that consistent use of condoms every time they have sex and having just one uninfected sex partner who has no other partners can reduce the chance of getting HIV/AIDS, compared with 82 percent of men.
can have HIV/AIDS, and they reject two common misconceptions about the transmission or prevention of HIV/AIDS. The level of comprehensive knowledge increases with the level of schooling, and it is much higher among those who are regularly exposed to media. Knowledge that HIV/AIDS can be transmitted from a mother to her baby is higher among women (84%) than among men (75%).

**HIV-related stigma**

Only three-fourths of women (76%) and men (74%) in Kerala would be willing to take care of a relative with HIV/AIDS in their home. A higher proportion of women (86%) and men (87%) say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. Seventy-three percent of women and 78 percent of men say that they would buy fresh vegetables from a shopkeeper with HIV/AIDS. However, less than half of women (45%) and men (44%) say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret. Overall, 28 percent of women and 29 percent of men express accepting attitudes towards people living with HIV/AIDS on all four indicators.

**HIV testing prior to NFHS-4, blood transfusions, and safe injections**

Only 12 percent of men and 43 percent of women age 15-49 had ever been tested for HIV prior to NFHS-4. Women and men in urban areas are slightly more likely to have ever been tested for HIV prior to NFHS-4 than rural women and men. Only 48 percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC. Urban women (46%) are slightly less likely than rural women (50%) to have been tested for HIV during ANC.

Less than half of women (48%) who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

In Kerala, 6 percent of women and men have ever had a blood transfusion. Thirty-six percent of men and 29 percent of women received any injection in the past 12 months. Among those who received an injection in the past 12 months, for 93 percent of women and 86 percent of men, a disposable syringe was used.

**SEXUAL BEHAVIOUR**

NFHS-4 included questions on respondents’ sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, higher-risk intercourse and condom use. In addition, men were asked whether they paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.
**Higher-risk behaviour**
Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past 12 months, 4 percent of men and less than 1 percent of women in Kerala reported having had higher-risk sex in the past 12 months. The percentage of men who had higher-risk sexual intercourse in the past 12 months was twice as high in rural areas (6%) as in urban areas (3%). Only 2 percent of men and less than 1 percent of women said that they had multiple sex partners in the past 12 months.

One percent of all men said they had paid for sex in the past year.

**WOMEN’S EMPOWERMENT**

**Women’s hygiene**
Using a hygienic method of menstrual protection is important for women’s health and personal hygiene. In NFHS-4, young women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In Kerala, 48 percent use cloth and 85 percent use sanitary napkins, 6 percent use locally prepared napkins, and 1 percent use tampons. Overall, 90 percent of women age 15-24 use a hygienic method of menstrual protection. Use of a hygienic method is lowest among women from scheduled tribes (71%) and scheduled castes (80%).

**Employment and earnings**
In Kerala, 21 percent of all women age 15-49 were employed in the 12 months preceding the survey, while in the same period 75 percent of all men age 15-49 were employed. Among employed women, 97 percent earned cash, including 1 percent whose earnings were in both cash and kind, and 3 percent were not paid at all. Almost all men who were employed earned cash, including men who earned cash and were also paid in-kind. Eighty-nine percent of employed women worked in non-agricultural occupations, compared with 92 percent of employed men.

---

**Twenty-one percent of all women age 15-49 were employed in the 12 months preceding the survey; 89 percent of employed women were employed in non-agriculture occupations.**

---

Among currently married women who work and are paid in cash, 91 percent decide how their earnings will be used, either alone or jointly with their husbands. Thirty-eight percent of women who work for cash say that they earn more than or about the same as their husbands. Eighty-one percent of currently married men who have wives who have cash earnings report that they alone or jointly with their wives decide how her earnings are used, and 33 percent of men who have cash earnings and whose wives have cash earnings say that their wife earns more than or about the same as them.
Decision making
Currently married women were asked who makes decisions about their own health care, major household purchases, and visits to their own family or relatives. Two-thirds of women (68%) participate in all three decisions. However, only 8-16 percent of women make each of these decisions alone. Overall, all of the decisions are most often jointly decided by women with their husband, and 8 percent of women do not participate in making any of the three decisions. Scheduled tribe women and women with no schooling are least likely to participate in decision making.

Currently married men were also asked who makes decisions about their own health care and major household purchases. Men were much more likely than women to report that they alone or jointly with their wife participated in both these decisions: 79 percent participated in making decisions about their own health care and 89 percent participated in decisions about major household purchases, while 6 percent did not participate in either of the decisions.

Other indicators of women’s empowerment
Two-fifths of women (40%) in Kerala say they have some money that they can decide how to use. The proportion of women with money which they control is slightly higher among urban women (42%) than rural women (38%), increases sharply with age, and is highest among women who are employed for cash (86%), women with one or two children (48%), women with 12 or more years of schooling (46%), and Christian and Hindu women (46-47%).

Seventy-one percent of women have a bank or savings account that they themselves use. The percentage is highest, at 87 percent, among women who are employed for cash. Women’s knowledge of microcredit programmes is quite widespread; 67 percent of women know of a microcredit programme in the area, but only 10 percent have ever taken a loan from a microcredit programme.

Seventy-one percent of women have a bank or savings account that they themselves use.

Only 12 percent of women are allowed to go by themselves to all three of the following places: the market, a health facility, and places outside the village/community. Women who are employed for cash have more than twice as much mobility (21%) as women who are not employed (10%).

Ownership of assets
Twenty-nine percent of women and 51 percent of men in Kerala own a house alone or jointly with someone else, and 23 percent of women and 36 percent of men own land alone or jointly with someone else. Ownership of both a house and land is higher for women in urban areas than in rural areas, and it increases with women’s age.
Twenty-nine percent of women own a house alone or jointly with someone else, and 23 percent of women own land alone or jointly with someone else.

Eighty-one percent of women have a mobile phone that they themselves use, and among women who have a mobile phone that they themselves use, 84 percent can read SMS messages. Owning of a mobile phone that they themselves use is lowest for women from scheduled tribes, women with no schooling or less than 5 years of schooling, and women age 15-19. Among women who have a mobile phone that they themselves use, almost all women age 15-24 can read SMS messages.

Eighty-one percent of women in Kerala have a mobile phone that they themselves use.

Gender-role attitudes
In Kerala, more than two-thirds of women (69%) believe it is justifiable for a husband to beat his wife under some circumstances. Women are most likely to believe that wife beating is justified if a woman neglects the house or children (49%), shows disrespect for her in-laws (46%), or if her husband suspects her of being unfaithful (40%). In the case of men, 58 percent say that wife beating is justified in some circumstances, especially if the wife shows disrespect for her in-laws (47%). Even among those who have completed at least 12 years of schooling, 67 percent of women and 59 percent of men say that a husband is justified in beating his wife for one or more of the specified reasons.

More than three-fifths of women (63%) of women and 70 percent of men believe that a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows that he has sex with other women, and if she is tired or not in the mood. Men (70%) are more likely than women (63%) to agree that a wife is justified in refusing to have sex with her husband for all three reasons. More than three-fourths (78%) of men agree that if a wife refuses to have sex with her husband he does not have right to get angry and reprimand her, to refuse to give her financial support, to use force to have sex even if she doesn’t want to, or to have sex with another woman.

DOMESTIC VIOLENCE
Among all women age 15-49 in Kerala, 13 percent have ever experienced physical violence and 5 percent have ever experienced sexual violence. In all, 15 percent of women have experienced physical or sexual violence. Among those who experienced physical violence since age 15, the most common perpetrator for ever-married women was the husband.
Fifteen percent of women age 15-49 in Kerala have ever experienced physical or sexual violence, which increases to 17 percent when emotional violence is included.

Violence during pregnancy
In Kerala, 1 percent of women who have ever been pregnant ever experienced physical violence during one or more of their pregnancies.

Spousal violence
Overall, 13 percent of ever-married women in Kerala have ever experienced any form of physical violence. Nine percent of ever-married women report having been pushed, shaken, or had something thrown at them by their husband and 7 percent have been slapped by their husband. Between 2 and 4 percent report having their arm twisted or hair pulled; being punched; or being kicked, dragged, or beaten up; and 1 percent each have experienced being choked or burned on purpose and being threatened or attacked with a knife, gun, or any other weapon. Three percent report that their husbands have physically forced them to have sex even when they did not want to and 1 percent report that their husband forced them with threats or other ways to perform sexual acts they did not want to perform. Overall, 14 percent of ever-married women have experienced spousal physical or sexual violence from their current husband or, if not currently married, from their most recent husband. Nine percent report ever experiencing spousal emotional violence (6% in the past 12 months prior to survey). Few ever-married women (2%) have ever initiated violence against their husband.

Although the prevalence of spousal violence is lower among more educated women, 7 percent of women who have at least 12 years of schooling have experienced physical or sexual spousal violence. Women who are employed for cash are more than twice as likely to have experienced spousal physical or sexual violence as women who are not employed. The contextual and intergenerational aspects of spousal violence are clear from the fact that women whose mothers were beaten by their fathers are about three times as likely to be in abusive marriages themselves as women whose mothers were not beaten by their fathers. Women whose husbands get drunk are much more likely than women whose husbands do not consume alcohol to experience physical or sexual spousal violence, especially if the husband gets drunk often (49%). However, 7 percent of even women whose husbands do not drink alcohol have experienced physical or sexual spousal violence. In fact, more than

Is alcohol use related to spousal physical or sexual violence?

Note: Category “Husband drinks, but never gets drunk” not shown since there are fewer than 25 unweighted cases.
half of ever-married women (52%) who have ever experienced spousal violence (emotional, physical, or sexual) are afraid of their husbands most of the time.

Nearly one-quarter of women (23%) who have ever experienced spousal physical or sexual violence have suffered injuries as a result of the violence. By far, the most common type of injury is cuts, bruises, or aches.

**Help seeking**

Only 28 percent of women who have ever experienced physical or sexual violence by anyone have sought help. More than half of women (54%) have neither sought help nor told anyone about the violence. Abused women who have sought help most often seek help from their own families (68%). Only 8 percent of abused women who sought help for the violence sought help from the police, and 4 percent sought help from social service organizations.

na = Not applicable

1 Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals.
2 Protected dug well, protected spring, rainwater, community RO plant
3 Surface water, unprotected dug well, unprotected spring, cart with small tank, tanker truck, bottled water
4 Total may add to more than 100.0 because households may use more than one method of purification
5 Appropriate water treatment methods include boiling, bleaching, filtering, and electronic purifying
6 Includes ventilated improved pit (VIP)/biogas latrine and twin pit/composting toilet
7 Facilities that would be considered improved if they were not shared by two or more households
8 Houses made from mud, thatch, or other low-quality materials are called kachha houses, houses that use partly low-quality and partly high-quality materials are called semi-pucca houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called pucca houses.
9 Electricity, LPG/natural gas, or biogas
10 Includes coal/lignite, charcoal, wood, shrubs/grass, agricultural crop waste, and dung cakes
11 Frequency of smoking by anyone inside the house
Table 5 Household possessions and land ownership

Percentage of urban, rural, and total households and de jure population possessing various household goods, means of transport, agricultural land, a house and farm animals and having a bank/post office account, health scheme/health insurance, a BPL card, and a long-lasting insecticide-treated (LLIN) mosquito net, Kerala, 2015-16

</table>

Note: First-order births are excluded from the table. The interval for multiple births is the number of months since the preceding pregnancy that ended in a live birth. Total includes information on births to women age 15-19, births to women who have no schooling or have less than 5 years of schooling, births to women belonging to “other” religions, births of birth order 7 or more, and births to women who don’t know their caste/tribe, which is not shown separately.

(1) Based on 25-49 unweighted cases

Note: Figures are based on life table calculations using information on episodes of contraceptive use that began 3-62 months preceding the survey. All methods includes male sterilization and pill, which are not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device
<sup>1</sup> Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation
<sup>2</sup> Includes lack of access/too far, costs too much, and inconvenient to use
<sup>3</sup> Reasons for discontinuation are mutually exclusive and add to the total in this column
<sup>4</sup> The episodes of use included in this column are a subset of the discontinued episodes included in the discontinuation rate. A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more effective method" as the reason for discontinuation and started another method within two months of discontinuation.
<sup>5</sup> Number of episodes of use includes both episodes of use that were discontinued during the period of observation and episodes of use that were not discontinued during the period of observation
<sup>6</sup> Includes injectables, female condom, diaphragm, foam/jelly, standard days method, LAM, withdrawal, and other modern and traditional methods that are not shown separately
<sup>7</sup> Includes other modern spacing methods that are not shown separately
<sup>8</sup> Includes other spacing methods that are not shown separately
<sup>( )</sup> Based on 25-49 unweighted cases

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Unmet need for family planning refers to fecund women who are not using contraception but who wish to postpone the next birth (spacing) or stop childbearing altogether (limiting). Specifically, women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant within the next two years, or are unsure if or when they want to become pregnant; pregnant with a mistimed pregnancy; postpartum amenorrhoeic for up to two years following a mistimed birth and not using contraception. Women are considered to have unmet need for limiting if they are: at risk of becoming pregnant, not using contraception, and want no (more) children; pregnant with an unwanted pregnancy; postpartum amenorrhoeic for up to two years following an unwanted birth and not using contraception. Women who are classified as infecund have no unmet need because they are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for limiting. Total includes women belonging to "other" religions, who are not shown separately.

1 Total demand is the sum of unmet need and met need
2 Percentage of demand satisfied is met need divided by total demand
3 Modern methods include female sterilization, male sterilization, pill, IUD/PPIUD, injectables, male condom, female condom, standard days method, diaphragm, foam/jelly, lactational amenorrhoea method (LAM), and other modern methods

(1) Based on 25-49 unweighted cases

</table>

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Unmet need for family planning refers to fecund women who are not using contraception but who wish to postpone the next birth (spacing) or stop childbearing altogether (limiting). Specifically, women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant within the next two years, or are unsure if or when they want to become pregnant; pregnant with a mistimed pregnancy; postpartum amenorrhoeic for up to two years following a mistimed birth and not using contraception. Women are considered to have unmet need for limiting if they are: at risk of becoming pregnant, not using contraception, and want no (more) children; pregnant with an unwanted pregnancy; postpartum amenorrhoeic for up to two years following an unwanted birth and not using contraception. Women who are classified as infecund have no unmet need because they are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for limiting.

1 Health personnel includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel. If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table.

2 Postnatal checks are checks on the woman’s health within 42 days of the birth.
Table 47 Delivery costs and financial assistance

The average out-of-pocket cost paid for delivery for the most recent live birth among women who had a live birth in the five years preceding the survey that was delivered in a health facility by type of facility, and among women who had a live birth in the five years preceding the survey for the most recent birth that was delivered in a health facility, the percentage who received financial assistance under Janani Suraksha Yojana (JSY), according to background characteristics, Kerala, 2015-16

</tr>
</tbody>
</table>

Note: Table is based on children who stayed in the household the night before the interview. Each of the indices is expressed in standard deviation units (SD) from the median of the WHO Child Growth Standards adopted in 2006. The indices in this table are NOT comparable to those based on the previously used 1977 NCHS/CDC/WHO Reference. Table is based on children with valid dates of birth (month and year) and valid measurement of both height and weight. Total includes children of birth order 6 or more, children whose birth size is very small or is not known, children whose mothers have no schooling or have less than 5 years of schooling, children belonging to “other” religions, children whose caste/tribe is not known, children whose mothers were not interviewed but were in the household and children whose mothers nutritional status is missing, who are not shown separately.

1 Recumbent length is measured for children under age 2, or in the few cases when the age of the child is unknown and the child is less than 85 cm; standing height is measured for all other children.
2 Includes children who are below -3 standard deviations (SD) from the WHO Child Growth Standards population median
3 Excludes children whose mothers were not interviewed
4 First born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval
5 For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.
6 Includes children whose mothers are deceased
7 Excludes children whose mothers were not weighed and measured, children whose mothers were not interviewed, and children whose mothers are pregnant or gave birth within the preceding 2 months. Mother's nutritional status in terms of BMI (body mass index) is presented in Table 70.
(1) Based on 25-49 unweighted cases

Note: Breastfeeding status refers to a "24-hour" period (yesterday and last night). Children who are classified as breastfeeding and consuming plain water only consumed no liquid or solid supplements. The categories of not breastfeeding, exclusively breastfed, breastfeeding and consuming plain water, non-milk liquids/juice, other milk, and complementary foods (solids and semi-solids) are hierarchical and mutually exclusive, and their percentages add to 100 percent. Thus children who receive breastmilk and non-milk liquids and who do not receive other milk and who do not receive complementary foods are classified in the non-milk liquid category even though they may also get plain water. Any children who get complementary food are classified in that category as long as they are breastfeeding as well.

(1) Based on 25-49 unweighted cases
Table 63 Median duration of breastfeeding and infant and young child feeding (IYCF) practices

Median duration (months) of breastfeeding among last-born children born in the last three years and percentage of youngest children age 6-23 months living with the mother who were fed with appropriate feeding practices based on the number of food groups and times they were fed during the day or night preceding the survey, by breastfeeding status and background characteristics, Kerala, 2015-16

</tbody>
</table>

Note: Total includes children whose mothers have no schooling or have less than 5 years schooling, scheduled tribe children, and children whose caste/tribe is not known, who are not shown separately.

1 Median durations are based on the distributions at the time of the survey of the proportion of births by months since birth. Includes children living and deceased at the time of the survey. It is assumed that children not currently living with the mother are not currently breastfeeding.

2 Either exclusively breastfed or received breastmilk and plain water and/or non-milk liquids only

3 Food groups are: a. infant formula, milk other than breastmilk, cheese or yogurt or other milk products; b. foods made from grains or roots, including porridge or gruel, fortified baby food; c. vitamin A-rich fruits and vegetables; d. other fruits and vegetables; e. eggs; f. meat, poultry, fish, shellfish, or organ meats; g. beans, peas, lentils, or nuts; h. foods made with oil, fat, ghee, or butter

4 Receiving solid or semi-solid food at least twice a day for breastfed infants 6-8 months and at least three times a day for breastfed children 9-23 months

5 Includes two or more feedings of commercial infant formula, fresh, tinned and powdered animal milk, and yogurt

6 Nonbreastfed children age 6-23 months are considered to be fed with a minimum standard of three Infant and Young Child Feeding Practices if they receive other milk or milk products at least twice a day, receive the minimum meal frequency, and receive solid or semi-solid foods from at least four food groups including the milk or milk products food group.

7 Breastfeeding, or not breastfeeding and receiving two or more feedings of commercial infant formula, fresh, tinned, and powdered animal milk, and yogurt

8 Children are fed the minimum recommended number of times per day according to their age and breastfeeding status as described in footnotes 4 and 6.

9 Not belonging to a scheduled caste, scheduled tribe, or other backward class

( ) Based on 25-49 unweighted cases

* Based on fewer than 25 unweighted cases.
Table 64 Child feeding practices and nutritional status of children by district

Among last-born children in the past 2 years, percentage breastfed within one hour of birth, percentage of youngest children under age 6 months living with the mother who are exclusively breastfed, and percentage of children under age five years classified as malnourished according to three anthropometric indices of nutritional status: height-for-age, weight-for-height, and weight-for-age, by district, Kerala, 2015-16

Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formulas (Centers for Disease Control (CDC), 1998. Recommendations to prevent and control iron deficiency in the United States. Morbidity and Mortality Weekly Report 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). Total includes information on children of birth order 6 or more, children whose mothers have no schooling or have less than 5 years of schooling, children belonging to “other” religions, children whose caste/tribe is not known, and children whose mothers were not interviewed but were in the household, which is not shown separately.

\(^1\) Excludes children whose mothers were not interviewed
\(^2\) For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.
\(^3\) Includes children whose mothers are deceased
\(^4\) Mildly anaemic is classified as 10.0-11.9 g/dl for non-pregnant women and 10.0-10.9 g/dl for pregnant women. Moderately/severely anaemic is <10.0 g/dl. Adjusted for altitude and for smoking status. Excludes children whose mother’s anaemia status is not known.

\(^{(*)}\) Based on 25-49 unweighted cases.

</table>

Note: Table is based on children/women who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude (and smoking status for women) using the CDC formulas (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. Morbidity and Mortality Weekly Report 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). The body mass index (BMI) is expressed as the ratio of weight in kilograms to the square of height in meters (kg/m²).

¹ For pregnant women, the value is <11.0 g/dl
² Excludes pregnant women and women with a birth in the preceding 2 months
Table 73 Knowledge and prevention of HIV/AIDS

Percentage of women and men age 15-49 who have heard of HIV or AIDS and who, in response to prompted questions, say that people can reduce the risk of getting HIV/AIDS by using a condom every time they have sexual intercourse, who know that the risk of HIV/AIDS can be reduced by limiting sex to one uninfected partner, who have a comprehensive knowledge about HIV/AIDS, and who know that HIV/AIDS can be transmitted from a mother to a baby, by background characteristics, Kerala, 2015-16

Note: Total includes women/men belonging to “other” religions, who are not shown separately.

¹ Partner who has no other sex partners
² Comprehensive knowledge means knowing that consistent use of condoms every time they have sex and having just one uninfected faithful sex partner can reduce the chance of getting HIV/AIDS, knowing that a healthy-looking person can have HIV/AIDS, and rejecting two common misconceptions about transmission or prevention of HIV/AIDS
³ Exposure to radio, television, or newspapers/magazines at least once a week or cinema at least once a month
⁴ For women, visits to parental/in-laws’ home excluded
( ) Based on 25-49 unweighted cases
* Percentages not shown; based on fewer than 25 unweighted cases

Note: Total includes women belonging to "other" religions, who are not shown separately.

SBP = Systolic blood pressure; DBP = Diastolic blood pressure

1 A woman is classified as having hypertension if she has SBP ≥140 mmHg or DBP ≥90 mmHg at the time of the survey, or she is currently taking antihypertension medication to control her blood pressure.

2 The term hypertension as used in this table is not meant to be a clinical diagnosis of the disease, but rather to provide an indication of the disease burden in the population at the time of the survey.

(1) Based on 25-49 unweighted cases.

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Total includes women age 15-19, women who have no schooling, women who are employed but not for cash, divorced/separated/deserted women, women with 5 or more living children, women belonging to “other” religions, women who don’t know their caste/tribe; and women who don’t know whether their father beat their mother, who are not shown separately.

1 Currently married women only
2 Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried children (biological, adopted, or fostered) with or without unrelated individuals
( ) Based on 25-49 unweighted cases

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women. Total includes women whose husbands drink alcohol, but never get drunk; women who are older or the same age as their husband; women who have never attended school and women whose husbands have never attended school; women whose husbands displayed 5-6 marital control behaviours, who are not shown separately.

¹ Currently married women only
² Behaviours include: is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money
³ Currently married women only. Decisions included are decisions about own health care, major household purchases, and visits to her family or relatives.
⁴ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn’t cook properly, he suspects she is unfaithful, and she shows disrespect for in-laws
⁵ Reasons given for refusing to have sexual intercourse with husband include: she knows her husband has a sexually transmitted disease, she knows her husband has sex with other women, and she is tired or not in the mood
⁶ Based on 25-49 unweighted cases

APPENDIX

ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) non-sampling errors, and (2) sampling errors. Non-sampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the fourth National Family Health Survey (NFHS-4) to minimize this type of error, non-sampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-4 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-4 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-4 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, \( r = \frac{y}{x} \), where \( y \) represents the total sample value for variable \( y \), and \( x \) represents the total number of cases in the group or subgroup under consideration. The variance of \( r \) is computed using the formula given below, with the standard error being the square root of the variance:

\[
SE^2(r) = var(r) = \frac{1 - f}{x^2} \sum_{h=1}^{H} \left[ \frac{m_h}{m_h - 1} \left( \sum_{i=1}^{m_h} \frac{z_{hi}^2}{m_h} - \frac{z_{hi}^2}{m_h} \right) \right]
\]
in which

\[ z_{hi} = y_{hi} - rx_{hi} \quad \text{and} \quad z_h = y_h - rx_h \]

where \( h \) represents the stratum, which varies from 1 to \( H \),

\( m_h \) is the total number of clusters selected in the \( h^{th} \) stratum,

\( y_{hi} \) is the sum of the weighted values of variable \( y \) in the \( i^{th} \) cluster in the \( h^{th} \) stratum,

\( x_{hi} \) is the sum of the weighted number of cases in the \( i^{th} \) cluster in the \( h^{th} \) stratum, and

\( f \) is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-4 sample for Kerala, there were 533 clusters. Hence, 533 replications were created. The variance of a rate \( r \) is calculated as follows:

\[
SE^2(r) = \text{var}(r) = \frac{1}{k(k-1)} \sum_{i=1}^{k} (r_i - r)^2
\]

in which

\[ r_i = kr - (k-1)r_{(i)} \]

where \( r \) is the estimate computed from the full sample of 533 clusters,

\( r_{(i)} \) is the estimate computed from the reduced sample of 532 clusters (\( i^{th} \) cluster excluded), and

\( k \) is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is also computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits (R±2SE) for each estimate are also computed.

Sampling errors for NFHS-4 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Kerala as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Table A.2 presents the value of the statistic (R), its standard error (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits (R±2SE); for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1).
