Dimapur’s poor get alms from Communication

The beginning of 2010, China has marked the end of what some people call the "golden year" for its telecommunication sector. The reason being the fact that China Mobile, the country’s biggest mobile operator, has reported an increase in revenue of 83.3% for the year 2009. The company has also announced that it plans to invest $15 billion in infrastructure expansion in the next few years.

China Mobile’s growth is mainly attributed to the increasing demand for mobile services, particularly in rural areas, where internet access was previously limited. The company has also implemented a number of initiatives to improve its network and service quality, including the introduction of 3G services, which have been well-received by customers.

In addition to its domestic market, China Mobile has also expanded its operations internationally, entering markets such as Africa and Latin America. The company’s rapid expansion has been driven by the growing demand for mobile services in these regions, as well as the opportunity to offer cheaper prices compared to local operators.

Despite the company’s success, however, there are concerns about the sustainability of its business model, particularly in terms of how it will be able to maintain its growth rate in the future. The company has also faced criticism for its pricing strategies and the quality of its services, which have been reported to be inconsistent in some areas.

Overall, China Mobile’s performance in 2009 has been impressive, and the company is well-positioned to continue its growth in the coming years. However, challenges remain, and the company will need to carefully manage its expansion and investment strategies to ensure its long-term success.
